

COMPREHENSION OF THE TRUTH

Aslan ÇAKMAK

COMPREHENSION OF THE TRUTH

Aslan ÇAKMAK

Every insight and reflection in this book is a gift from its True Owner; any mistakes or shortcomings, however, belong solely to me.

If what is written here can serve as a means for a heart to attain faith, or as a window for a heart that has already believed, then it will have fulfilled its purpose.

These verses were originally written in the Turkish language as a praise, a supplication, and a munajat to Allah. Since the features concealed within them would vanish when translated into another language, it has been deemed appropriate to leave them in their original language.

YA VEDUD.. YA VEDUD.. YA VEDUD..

Alemlerin rabbi olan ey güzel Allah'ım,
Lütfedersin merhametini canlıya taş,
Layıktır o rahmetine müminler bilhassa,
Anlayacak herkes mülkün gerçek sahibini,
Hak Teâlâ paklarsın hem insanı hem cini.

Ayağı kayanı çıkarırsın selamete,
Lebbeyk! Ya ilahi, güvenilir vaadine.
Lehimleyen kâinatı, koruyan, gözeten,
Aziz rabbim, en yüce, yegâne galip gelen.
Hükmünü her durumda ilelebet geçiren.

Akıllar aciz kalır, büyüklükte yok eşin.
Lanet sarsın inkârı, sen, yoktan var edersin.
Lainler göremez ki uyumlarla ahengi,
Ayağı eli yaratanın olamaz dengi.
Hepimizin günahlarını affet ya Bengi.

Aşağı düşer tüm boyunlar senin karşında,
Lütfun boldur ihsanının eşi yok arşında.
Laakal sonsuz lazım rızıkları saymaya,
Açansın her kapıyı ihtiyaç çok aymaya,
Hakkıyla bilensin, yetişilemez saymaya.

Alırsın dilediğinden, rızkı daraltırsın,
Lüksü katmerler, istersen fakrı azaltırsın.
Lağv edersin, kişi ilah ettiyse nefsinin,
Arşa yükseltirsin Allah ettiyse lafzını,
Haşmetinle kulun izzetini çoğaltırsın.

Aman isteriz ya rabbi düşürme zillete,
Lâ desek duyarsın, yazık olur bu millete,
Lazım bize hakkıyla gören, rahmetin yüce.
Aciz kulların secde eder bu hakem güce.
Herkes adilsin, adaletinde yok gece.

Aliyy ve ince, lütuf sahibisin ya Alim,
Latîf ve haberdarsın ya Hak, korkar her zalim.
Laubali davransa da kul, bekler ya Halim,
Azimsin mutlak büyüklük sahibi Er- Rahman,
Habirsin, muhtacız, bağışla bizi ver aman.

Az amele bile sen çok mükâfat verirsın,
Lekeden uzak yüksek mertebe sahibisin.
Lisanlar seni över, gücünü akıl almaz,
Aşkın muhafazanda zerre eksiklik olmaz.
Helal tayin rızıkların kursaklarda kalmaz.

Azıcık dahi olsa hiç kaçırmazsın hesap,
Layezal heybetini yazmaya yetmez kitap,
Lezizgüzar, ikram eylemekle kalmaz bitap.
Allâmu'l-guyûb kullarını her an gözetin,
Hasib O, tüm dualara tek başına yeten.

Azametlidir, geniştir ilim ve rahmeti,
Lâhutî her işi sağlamdır vardır hikmeti,
Lika ile yanıyorum kül oldum ya Vedud!
Al ruhumu! Şan, şerefin tanımaz had hudud.
Hayy! Bais! Ey Muid! Yanı başında ver vücud.

Agâh rabbim şahittir, haksızlık kalmaz yana,
Lâyetegayyer Hakk'tır, âleme sığmaz mana.
Lâyık-ı Tevekkül, olsun Muhammed'e selam,
Azm-i metîn El Kaviyy hiç yenilmez vesselam
Hısın-ı Hasîn kudret, nasip eyle Dârüsselam.

Avn-ı ilahi dosttur, yardım eder kuluna,
Lillâhi'l-Fedadır her ruh, hamd eder yoluna
Levh-i Mahfûz yazıldı, Muhsî eksiksiz bilir,
Ahdası yoktan yarattı ilmi önde gelir.
Halk-ı ahiret insan, önce dünyada ölür.

Ab-ı hayat kudreti, yaşamın Miftâhdârı,
Layemut mabudum ölümün mucizedarı.
Lâ-hayy illâ hû sensin diri Muhyi ve Mumit
Ayakta tutan kainatı Vacid El Macid,
Hazinen tükenmez boldur, ey Vahid-ül Mecid.

Asil şeref sahibi, izzetinin yok eşi,
Lâ-yenkasım ilahi, teksin, yok üçü beşi,
La-yezal Samed'sin muhtacız Allah'ım sana.
Akvâ kalamaz hiç kimse Kadrinin yanında,
Her şeye gücü yeten Muktedir sarayında.

Akdem eder isterse, kula hesapsız verir,
Lecmeder dilerse fersah fersah geriletir.
Lâ-ibtidâ Mukaddim tanıyamadık seni,
Ahir ve'l-Kuddûs, haksı, yak bu gafil bedeni,
Hakem ve'z- Zahir kahret sana engel nedeni.

Amayız akıl göremez özelliklerini,
Lâ yû'addü ve lâ yuhsâ yönettiklerini,
Letafetini, makamını, bildiklerini,
Atıfletle yaklaşıp çokça sevdiklerini,
Hulûs ile o tövbeleri kabullerini.

Alır intikamı, hakkını koymaz kimsede,
Lazıme sorumluluk bırakmadan af ede.
Lütfen sevginle sar beni evkat-ı hamsede.
Alemlerdeki bütün mülkleri edersin râm,
Heymenet ile sınar Zülcelali vel ikram.

Adilane hükmeder mazlumunu kurtarır,
Lücce-i mahşerde tüm zalimleri toplatır.
Lebriz hazineleri arşı ferşi aşıyor,
Arzu ettikleriye saraylarda yaşıyor,
Hâil olan sebepler tüm boyları aşıyor.

Acıyı veren de eleme veren de sensin.
Levazım-ı hayr olan ne varsa var edensin.
Loş, parlak demeksizin nurlandıran Ahsensin.
Azsa da düşse de kula hidayet verensin.
Hâdî-vü Bedî eşsiz, örneksiz halkedensin.

Afv-ü Bâkî'sin yok sonu varlığının kadim,
Lübbü miras ve servetler yalnız sana hadim,
Ledünnî ilm ile gösterirsin doğru yolu,
Azab etmez rabbim hemen, kula sabır dolu,
Hilkat-i necat ey nas! Sadece Allah yolu.

Aslan ÇAKMAK

INTRODUCTION

I have observed that, in our time, a person who wishes to learn his religion often struggles to find a sound and reliable source. The vast majority of the sources he can access tend to be top-down presentations delivered from an authoritative voice, frequently employ archaic language, and are therefore difficult to understand. Moreover, their monotonous style often begins to bore the reader after a short while. I also believe that, especially due to the pervasive influence of social media, reaching accurate information has become increasingly difficult. For this reason, rather than providing lengthy textbook-style information, my aim is to encourage the reader to engage in tafakkur (deep reflection) on certain realities that are actually before our eyes, yet often go unnoticed, or whose significance we fail to appreciate. Through brief sparks of thought, I hope to inspire reflection on aspects of these matters that we may not have previously considered.

The entirety of my writing is grounded in the Qur'an, the Sunnah, authentic hadith, as well as science, logic, and reason. Rather than filling these pages with extensive academic references to verses, hadiths, and scholarly articles, my intention is to use a clear, simple, and straightforward language as much as possible, allowing readers of all ages to embark together on a journey of reflection in the atmosphere of a sincere conversation.

Although the intended audience of the first book, "I REFLECT A LOT", included readers of all ages, it was primarily directed toward those who already believed but were unable to fully live their religion or had not yet fully comprehended it. The work

you are now reading, "I DOUBT A LOT", likewise addresses readers of all ages; however, it is primarily aimed at those who have questions regarding faith and who sincerely seek to reach the truth. For this reason, the language used in this book may be somewhat heavier, more critical, and at times even sharper than that of the first book.

My advice is this: if your genuine goal is to reach the TRUTH, then allow your pride, the fabricated information and beliefs you may have accepted until now, and your ego to be challenged. Do not immediately become defensive. If someone you love remains asleep while flames surround them, a firm slap to awaken them may be necessary for their salvation. Therefore, if you occasionally feel as though you have been struck by a slap while reading this book, I hope you will never forget that it is intended as a compassionate slap for your deliverance.

Even the Prophets never brought anyone to faith by force. Guidance (hidayah) is granted only by Allah. In Islam, one's responsibility is only to convey the message. Therefore, this book may not meet the expectations of readers whose hearts have become completely hardened and whose hearts have been sealed.

"Indeed, those against whom your Lord's decree has become binding will not believe, even if every sign were to come to them, until they see the painful punishment."
(Yunus 10:96-97)

For this reason, I wholeheartedly and sincerely invite those readers whose hearts have not yet been sealed and who genuinely seek the truth to the realities presented in this book.

My request to you is that you do not read what is written here as though you were reading a novel. Step back, read objectively, listen to your heart, and reflect deeply as you read. Let your aim not be conflict, but rather to benefit in whatever way you can.

Sadly, although there is much that we hear around us, there is very little that we truly listen to with our hearts.

بسم الله الرحمن الرحيم

“WHAT IF THERE IS NO HEREAFTER? THEN WE WOULD HAVE LIVED AND DIED LIKE GRASS IN A FIELD”

The existence of different possibilities regarding a matter does not change the reality itself. “What if a flowerpot falls on my head?” “What if I fall into a sewer while walking down the street?” The fact that such possibilities have the potential to occur does not mean that they actually will. Likewise, when a person says, “What if there is no Hereafter?” this does not mean that “there is no Hereafter.”

At its current stage, science is still unable to prove either the existence or the non-existence of the Hereafter verifiable. Therefore, we cannot arrive at the existence of the Hereafter through science alone.

In this case, logic, probabilities, observation, and reasoning come into play; either the Hereafter exists and what people do carries significance forever, or the Hereafter does not exist, and consciousness ceases with death.

According to the UBS Global Wealth Report and the World Inequality Report, only 10% of the world's population possesses enough wealth to satisfy what the average person expects from being rich. This means that among those who live as though there is no Hereafter and seek happiness and wealth in this world, only 10% are able to achieve their goal. According to these reports, 70% of that 10% inherit their wealth from their families. This means that only 0.3% of the world's population (the remaining 30% who attain that level of wealth by actively pursuing it) can achieve a partial form of happiness through the pursuit of wealth. In summary, only 3 out of every 1,000 people are able to attain satisfying wealth from scratch.

Moreover, even those who reach such wealth lose their youth and health in the process. The average age of those who attain it is between 54 and 55. The current global average life expectancy, on the other hand, is approximately between 68 and 70 years.

This means that only 3 out of every 1,000 people in the world are able to attain satisfying wealth, and they can do so only around the age of 55, perhaps enjoying it for merely 13 years. By the time one reaches the age of 55 to 68, neither energy nor health. For something to be considered scientific, it must be observable and

experimentally remains. You can no longer travel and explore with the ease of youth, nor can you eat whatever you desire without limitation. Neither will your biological functions nor your hormones remain at the level necessary to experience sexuality as before. Of course, there may be exceptional cases, but the predominant reality is as described.

When we calculate the risk, the potential gain of living as though there is no Hereafter is minuscule compared to the cost of being mistaken.

For a person who lives as though there is no Hereafter, life, excluding the years of childhood during which there is no accountability in Islam, consists of spending approximately 50 to 60 years chasing a relatively happy outcome with only a three-in-a-thousand chance of success. (I say “relative happiness” because neither the things we pursue nor wealth itself always bring happiness. Suicide rates are significantly higher in wealthier societies.)

If the Hereafter exists, the price of such a life is to cry out in agony forever.

(Do not simply read and move on! Stop...

Imagine yourself crying out while burning in the Fire for eternity. Imagine your skin melting away from your bones and the pain you would experience at that moment. Then imagine your body being restored and the same suffering being inflicted upon you again and again, forever.

Not for an hour, not for a day, not for a year, but forever...

Give yourself a minute or two and think about this alone.

It is extremely important that you do not brush aside this reflection. Your mind will want to escape from it or dismiss it because it feels uncomfortable. Do not run away from it. Do not dismiss it.)

Living as if the Hereafter exists, on the other hand, amounts to little more than washing your hands and face 4-5 times a day and spending, in total, about 30 minutes in meditation and gentle movements involving bowing and sitting, which also help maintain healthy blood circulation, over an average lifespan of 50-60 years.

The return for doing this is eternal happiness and having everything you desire forever.

Let us imagine a teacher coming to a group of children and saying, “There may be a major exam on Friday.” One student says, “What if there is no exam? Then I would have missed the chance to play.” Another student says, “But what if there is an exam?” and begins studying.

If Friday arrives and there is an exam, the student who did not prepare pays a heavy price. But if there is no exam, the student who studied has only spent a little time preparing and has not suffered any great loss.

Imagine that you are playing a computer game and, at the end, a “Save” button appears. Pressing it may save your progress, or it may not. But if it does, all of your efforts will be preserved.

At that point, the rational thing to do is to press the button regardless of whether it saves or not, because the cost of pressing it is small, while the cost of losing everything is great.

The rational course of action, when faced with a significant risk, is to take precautions against that risk.

One of the windows that logically leads us to the existence of the Hereafter is the issue of justice.

We see both good and evil in this world. Is the universe truly nothing more than this? Does everyone simply get away with whatever they do?

If death ends everything, then justice remains unrealized forever.

At this point, the human mind longs for justice. Why?

The sense of justice has existed in nearly every culture throughout history. But is this universal expectation of justice really there for something that will never be fulfilled?

Another window is the human conscience.

The only thing that restrains a person from doing evil is not punishment.

Speaking generally, some people experience what we call “a guilty conscience” because of evil they have committed or even considered committing, even when no one sees them and no one knows.

Although science may not yet be able to define it completely, we know that what we call a guilty conscience is real.

So why does a person behave as though there is a court within them that is greater than themselves? Why?

Another window is the soul.

There are two bodies composed only of flesh and blood. One speaks, cries, feels, has emotions, and has dreams. The other lies motionless.

What is the difference between a living human being and a dead one?

Materialism claims that the brain functions much like a computer: input (signals) enters, neurons fire, and output (responses) emerges.

However, this explanation cannot account for the phenomenon of subjective experience.

A computer can detect the color red through a camera and read its code. But can it actually see red and derive aesthetic pleasure from it?

When a neuron transmits an electrical signal, how does that become a subjective experience such as pain, the scent of a loved one, or the color red within your mind?

There is an enormous gap between electrical signals and the inner experience we feel while living through them.

How does physical matter (neurons) transform into a non-physical experience?

This experiencing self is one of the greatest evidences for the soul and consciousness.

Through fMRI scans, we can observe which neurons fire and when.

But when those neurons fire, why is there an observer behind them?

Biologically speaking, we do not need an inner observer (consciousness/soul) merely to survive and react.

If we claim that nature and evolution brought us together through random processes, then we could have been made into biological machines that simply provide input and output, much like robots or computers.

If we are to think in purely materialistic terms, that would be the logical expectation.

Yet reality is not like that.

We experience an inner “self.”

Where, then, is that observer located within matter?

(Science currently has no answer to this question.)

Imagine a brilliant scientist named Firdevs.

Firdevs has spent her entire life in a black-and-white room and has never seen the outside world. However, she knows EVERYTHING about the physics, biology, and neuroscience of colors.

She knows exactly what wavelength the color red has and precisely which areas of the brain are activated when red light enters the eye.

Question:

When Firdevs finally leaves her room one day and sees a real red apple for the first time, does she learn something new?

Yes!

She learns what red actually looks like.

This means that knowledge is not limited to physical or material information alone.

Beyond physical knowledge, there is also an experienced and non-material dimension.

Biologically speaking, nearly all of the cells in our bodies are replaced every few years.

Not a single atom from your body ten years ago remains in your body today.

If you are nothing more than matter, and the matter that composes you has changed completely within ten years, then how can the “you” of ten years ago and the “you” of today still be the same person?

What is that stable essence that makes you you, that allows you to remember a childhood memory and say, “That was my memory”?

This shows that beyond changing matter, there is a stable self or essence.

Call it consciousness if you wish, or call it the soul. I would recommend calling it the soul.

According to a completely materialistic worldview, everything in the universe operates according to cause-and-effect relationships governed by the laws of physics.

In that case, the human mind would also be nothing more than the movement of atoms, and free will would not truly exist; it would be merely an illusion.

If there is no soul or mind independent of matter, then an atheist's disbelief and my defense of the soul are both simply the result of random chemical reactions occurring in our neurons.

In other words, neither of us arrived at our position through genuine reasoning. We are merely experiencing a biological domino effect.

If we respond by saying, “Of course not. I can close this book right now if I choose. I can choose not to think about it. I have free will. The universe cannot simply be a chain of dominoes,” then we are accepting the existence of free will.

And if we accept free will, then we must also accept a mind or soul capable of making decisions beyond matter.

For those who say, “All of this is simply the result of the brain's complexity. One day science will discover how the brain produces consciousness,” it should be noted that this is not merely a scientific unknown.

It is a categorical philosophical distinction.

No matter how advanced our maps of the brain become, all we will ever find is more electricity, more hormones, and more tissue.

No matter how closely we examine matter, we cannot place meaning, love, or subjective experience inside a test tube.

The brain may be the instrument or receiver of the soul/consciousness, but it does not necessarily have to be its source.

Just as breaking a television causes the broadcast to disappear from the screen, yet the source of the broadcast is not the circuitry inside the television itself.

Another window that opens toward the existence of the Hereafter is the patterns of completion we observe in the world.

When we look at the universe and at what it contains, we continually see similar forms, similar signatures, similar systems, and similar completions.

LIGHTNING

LIGHTNING

EYE VESSELS

EYE VESSELS

BLOOD VESSELS

STAR DEATH

TREE

CELL BIRTH

Look around you: a seed enters the soil as though it were dead, then suddenly it sprouts. A caterpillar enters its cocoon as though it dies and becomes mummified, then emerges as a butterfly. Think about the baby in its mother's womb: it does not see light, yet it has eyes; it does not hear sound, yet it has ears; it does not speak, yet it has a mouth; it does not breathe air, yet it has lungs. No matter how much you try to describe the sun, its mother and father, music, water, or countless delicious foods to that baby, its reality is limited only to the world inside the womb.

If that baby were to deny and reject the existence of the world outside the womb, claiming that real life consists only of life within the womb, a person living in the outside world and looking at that baby from the outside would do nothing but smile at the baby and its beliefs, would they not?

Human beings today likewise possess many faculties such as a sense of justice, a longing for eternity, a desire for immortality, a search for truth, the capacity to love, morality, and conscience. (If we continue with the analogy of the baby, these would be its organs.) So how reasonable is it to think that all of these faculties exist only for a life of fifty or sixty years?

Moreover, many of these faculties themselves, such as the desire for immortality, the longing for absolute justice, and unlimited desires to eat, drink, travel, see, smell, and experience more and more, have no complete fulfillment within this world, just as the baby's organs have no complete fulfillment within the womb.

When justice, conscience, consciousness, the search for meaning, and observations concerning human nature are considered together, the conclusion that there is an Afterlife (Ākhirah) becomes the most reasonable conclusion that an intellectually reflective person can accept. This conclusion is not a mathematical proof. It does not tear away the veil of the Afterlife and point with a finger saying, “Look, here is the Afterlife.” However, it demonstrates that belief in the Afterlife is not merely a wishful hope, but rather the most reasonable conclusion that can be accepted. The greatest strength of this conclusion is that multiple independent observations support and point toward the same reality. Therefore, for a person who uses reason and sincerely seeks the truth, the existence of the Afterlife becomes unavoidable.

One of the truths that must be repeated time and again is this: even if proofs weighing as much as a thousand trucks could carry were presented to a closed heart, that heart would still continue to object. The responsibility is to convey the message; the rest is between the individual and his Creator.

What does the Qur'an say?

“Indeed, We have created many of the jinn and mankind for Hell. They have hearts with which they do not understand, eyes with which they do not see, and ears with which they do not hear. They are like cattle; rather, they are even more astray. It is they who are the heedless.” (Al-A‘rāf 7:179)

“Indeed, those against whom your Lord’s decree has become binding will not believe, even if every sign were to come to them, until they see the painful punishment.” (Yūnus 10:96-97)

IS IT ALLAH OR MATTER THAT IS ETERNAL?

David Hume says, “A person cannot even imagine what they have never seen.”

Descartes asks, “Why do I have the concept of heat in my mind? If there really were no such thing as heat, could I have the concept of heat in my mind?”

He answers, “No. For me to have the concept of heat in my mind, heat itself must exist. Something that does not exist cannot have a place in my mind,” and reaches the following conclusion:

“Therefore, if I can have the concept of a perfect God in my mind, that perfect God must necessarily exist.”

At this point, some readers may ask, “Then, if I imagine myself with eight legs in my own mind, does that mean that my eight-legged version must also exist?”

No, it does not.

What is meant here is this: the fact that you can imagine yourself with eight legs means that the concepts of ‘leg’ and ‘human’ exist. You can imagine a human being with eight legs because of this. It means that if the concept of a “leg” did not exist at all, you could not imagine something with legs. The concept of

a “leg” exists, and the concept of a “human” exists. Whether you have eight of them or none at all does not change anything.

For this reason, if there truly were no Creator, we would not be able to discuss the concept of a God who is omnipotent, who can exist everywhere at the same time, nor could we discuss the existence or non-existence of such a God.

One of the fundamental errors into which beliefs other than Islam fall is precisely here. All religions, as well as science, accept eternity (the absence of a point of beginning, or the state or quality of having no initial moment in the past).

While Islam attributes this quality to Allah, other religions attribute it to matter.

If we do not attribute eternity to Allah, then we must necessarily attribute it to matter and accept that matter is without time and without space.

Matter, by its very nature, is in motion, and according to the laws of physics, this motion must have been initiated at some point through the application of force. Whether it was the Big Bang or some other cause, it must have started its motion from something. Reason and logic require us to accept this.

The discussion therefore centers on the question: “To whom does the attribute of eternity belong?” Is it Allah who is eternal? Or is it matter?

The non-believing view argues that all the properties by which the systems in the universe operate, from the orbits of planets to the orbits of atomic particles, and to the unique characteristics with which ants, birds, and bees are born, are inherent within matter itself. Islam, on the other hand, maintains that all these systems came into existence through the creation of Allah.

In such a case, the non-believing line of thought asks, “Well, if Allah created everything, then who created Allah?” Yet within its own system, it never asks, “If everything comes from matter, then how did matter itself come into existence before that?”

A person who knows that they are right is open to everything and has no need to twist arguments or manipulate them in order to prove themselves right. If, in a communication, one side begins resorting to twisting things or applying double standards, they do so because they genuinely feel the need to.

If one side asks you certain questions and holds you responsible for certain answers, but does not ask the same questions of itself or hold itself to the same standard, this shows that the other side is aware that it is in the wrong and is desperately trying to justify its own position.

Just as one atom cannot make another atom, one eye cannot create another eye, and one car cannot make another car, a camera can only be made by someone who can see, and a loudspeaker can only be made by someone who can hear. Likewise, an eye can only be made by someone who can see, and an ear can only be made by someone who can hear. It is rationally impossible for an

unintelligent, unconscious atom, which we call the building block of matter and which has neither the ability to see nor to hear, to create a living being.

The human mind has the capacity to understand eternity and the existence of the Creator, but it does not have the capacity to understand what the Creator is like or how He is. Both the mindset that denies the Creator and the agnostic (skeptical) mindset say, “We cannot know the Creator.” Islam, however, says: “We cannot know the essence of the Creator, how He is, what He resembles, or His very Person, but we can know His attributes.” Not knowing Allah’s Person does not prevent us from understanding His existence.

It must be remembered that a person’s inability to understand a phenomenon never means that the phenomenon does

not exist, and therefore that one will not be held accountable for the consequences of one's actions.

In Islam, the reason why the "first cause" is accepted as God is that it must necessarily be so. It is not a blind or arbitrary acceptance.

Let us remember once again: if there is a beginning, then it is either the Creator or matter. If we do not attribute eternity to the Creator, we are compelled to attribute it to matter. This leads us into a contradiction. Because if we do not attribute eternity to the Creator, we will have to say, "Every form of matter, every atom, is eternal." We will also have to say, "The movement, displacement, and aging of every form of matter and every atom are eternal."

It is a fundamental principle known in logic, philosophy, and science: "Motion cannot be eternal; the beginning of motion is zero." Therefore, an object that cannot be separated from its attribute cannot itself be eternal if its attribute is not eternal.

Even Aristotle, when considering this matter, had to attribute eternity to matter because he knew that Zeus could not create the world. Yet Aristotle was intelligent and was also aware of the problem that arose, because motion cannot be eternal; therefore, matter cannot be eternal either, and he fell into a contradiction with himself. At this point, he was compelled to invent the concept of "matter without matter." He was able to say, "Matter without matter has no need for motion; therefore, it is eternal."

At this point, Islam says: “There is no need to invent such a thing as matter without matter. Here is the Creator. Allah exists. Rather than attributing eternity to infinite numbers of atoms, is it not more reasonable and logical to attribute eternity to one Being?”

At this point, one might naturally ask: “We did not attribute eternity to matter; we attributed it to Allah. But how do we understand that Allah created all atoms simultaneously and that He can exist everywhere at the same time?”

We arrive at this conclusion by looking at the matter around us. Throughout the universe, we see similar movements, almost like signatures. One of these is the “elliptical motion” we observe. When we turn our heads toward the heavens with telescopes and toward the ground with microscopes, we see this elliptical motion. Galaxies, planets, stars, and satellites all exhibit this elliptical motion, and we see the same kind of motion in atoms and electrons as well. This means that both the smallest structure and the largest system bear the same signatures under the same roof. This points to the fact that the existence of both originates from a single source and leads us to the thought that, “Whatever enables the small system to exist is the same thing that enables the large system to exist.”

The trees in the north of the Earth and the trees in the south grow in the same way at the same time. The eye of a fly in the north and the eye of a fly in the south are formed in the same way. The bird in China builds its nest in the same way, and so does the bird in France. From this, we can understand that their existence originates from a single source. If there were multiple powers, we

would neither see these signatures that are harmonious with one another and point to a single power, nor would we fail to encounter confusion and disorder somewhere.

When we consider the signature of elliptical motion, this motion is a more difficult motion than classical circular motion because it necessarily requires control from two centers.

Classical circular motion can occur through a constant force applied from the center, whereas in elliptical motion, the speed increases as an object approaches the ends and decreases as it moves away from them. The increase and decrease in speed logically means that there is a form of control, a specific influence acting upon that system.

According to the fundamental laws of physics, if there is motion, then there must be a cause for that motion. Motion can only arise from a force. We observe that atoms and planets continue their motion continuously. So, what is the cause of this orderly motion?

It is continuous intervention.

For those who say, “But what about the Sun’s gravitational force?”, it should also be pointed out that:

Centrifugal force is an imaginary (fictitious) force that a body undergoing circular motion (elliptical, not circular!) appears to experience as if it were being thrown outward from the center due to its inertia.

Centrifugal force is not, in reality, a physical force; it arises from the tendency of an object to continue moving in a straight line (inertia). It is the perception of the centripetal force, which accelerates the object toward the center, within an accelerating reference frame.

For example, when you are inside a car making a turn at high speed, you feel as though you are being thrown toward the door. There is no actual force pushing you outward; because your body tends to continue moving in a straight line, as the car turns beneath you, you appear to be thrown outward.

The Sun pulls the Earth toward itself, while the Earth supposedly wants to be thrown outward by centrifugal force.

However, this applies to circular orbits. In fact, since it has no practical counterpart, it may not even be regarded as valid.

For those who ask, “Does ‘centrifugal force’ have no counterpart?”, let us explain. Yes, in practice, it has no counterpart.

For example, let us place a gigantic magnet on the ceiling, and place a steel ball between gravity and the magnet, attempting to keep it suspended in the middle. Can we do it?

We cannot.

In theory, it should remain stationary.

However, it will not remain in equilibrium. Even if there were an instantaneous point at which the magnetic force and gravitational force were equal, this would be an unstable equilibrium.

When the steel ball is at this point,

if it moves even a micron closer to the magnet, the magnetic attractive force increases, and the ball sticks to the ceiling.

If it moves even a micron farther away from the magnet, the magnetic force weakens, and gravity prevails, causing the ball to fall to the ground.

It is physically impossible to keep an object suspended indefinitely in the air using only two constant sources of force, namely a stationary magnet and gravity.

Yet we see this very system, which is practically impossible, functioning perfectly throughout both the largest systems of the universe and its smallest particles. Moreover, unlike the steel ball in our example, they do not even remain stationary. They move forward while simultaneously maintaining their elliptical orbits. (Helical motion)

The electrons inside atoms are very far from the center. When a hydrogen atom model is enlarged, an electron is about the size of a pinhead placed 2 kilometers away from a football, and it is in a very high-speed helical motion. We know that, due to Unstable Equilibrium, it is practically impossible for matter to remain stationary without being thrown off or scattered.

So, how is the electron able to move so fast? How can it remain so orderly while moving at such a high speed? How can it continuously maintain this highly regular and rapid structure without becoming disrupted or being thrown off? If an electron were to leave its orbit, the atom would also disintegrate. So how does it preserve its structure without falling apart?

How, then, can this physically impossible situation occur?

There is motion, and if there is motion, there must be a force. If there is orderly motion, then an orderly force must be applied. If we say that Allah does not exist, or if we adopt an agnostic perspective and say that we cannot know whether Allah exists, then how are we going to explain the existence of this physically impossible motion; the order and systematic nature of this physically impossible motion; and the continuity of this physically impossible motion?

Those who have knowledge of physics will immediately object to what has been said and say:

“These are incorrect claims about physics. Elliptical orbits were fully solved mathematically centuries ago through Newton’s law of gravitation and Kepler’s laws, and this is known as the ‘two-body problem.’ The planet accelerating as it approaches the Sun and slowing down as it moves away does not require ‘continuous intervention’; it is automatically explained by the conservation of angular momentum. No additional ‘control’ or ‘regular intervention’ is required. This is a calculation that has been taught

at the undergraduate level for three centuries and is still used today to launch satellites. Masses attract one another according to their masses and the inverse square of the distance between them, and from this single equation, the fact that planets trace ellipses and that their speed increases at perihelion and decreases at aphelion (Kepler's Second Law = conservation of angular momentum) can be mathematically derived."

I do not object to this explanation in the first place. We express the mechanism we have arrived at as a result of our observations in this way. However, this is not the answer to the question, "Why is all of this the way it is?!"

That is precisely what this article is intended to explain and demonstrate.

Fine, the inverse-square law mathematically produces this result. Accepted. But why is there an inverse-square law in the universe? Why this law rather than another? Why do masses attract one another rather than repel one another? Why are these constants, such as the gravitational constant G , the speed of light, and so on, set at these particular values? Who determines all of these things? What is the source of these properties being the way they are?

All of these calculations cannot be performed by lifeless and unintelligent matter. The determination and establishment of all these things requires consciousness, knowledge, and power.

This is where physics truly falls silent. Physicists honestly refer to this as a "brute fact", meaning: "The universe is this way

because it is this way; this is our starting point, and there is no deeper explanation.” Stephen Hawking’s famous question points to precisely this issue: “What is it that breathes fire into the equations?” In other words, why do mathematical laws exist, and why do they operate? Physics cannot explain this.

And look at how two chickens explain what the entire scientific community cannot explain.

A human being creates a mechanism for the chickens. At certain times during the day, the mechanism opens the lid of a suspended feed container, causing the feed inside to fall down.

After creating the mechanism, the human places eggs inside and begins observing them with hidden cameras.

The chickens hatch as chicks inside the mechanism and begin to live there. Over time, they grow. Some of the chickens begin observing the mechanism.

After a while, one chicken begins explaining its observations to the chicken next to it.

Science Chicken: I have observed that every time the lid opens, the feed falls down. In science, the falling of feed from the air is called the “law of feed attraction.”

Muslim Chicken: But what is the reason the feed falls?

Science Chicken: I do not know the reason, but whenever the lid opens, the feed falls. This is also called the “law of feed attraction.”

Muslim Chicken: I think this mechanism could not have come into existence by itself, because the container has no mind, the pipe has no mind, and neither the wood nor the ropes have a mind. I think there is an intellect, a consciousness, and knowledge behind this mechanism. I think a human being made it.

Science Chicken: I have never seen anything called a human being in my life. Therefore, human beings do not exist.

Muslim Chicken: If there are no human beings, then how does this complicated mechanism remain continuously balanced and keep operating without stopping?

Science Chicken: I do not believe in anything I cannot observe through experiments. The laws of feed attraction explain this mechanism perfectly anyway.

Muslim Chicken: You have merely given a name to the part of the mechanism that you can observe, and you have called it a law. Your “law” does not explain how the mechanism itself works.

Science Chicken: This mechanism has always existed. Over billions of years, all atoms experimented randomly, accumulated, and eventually formed the cell. Then the cells multiplied through trial and error and became dinosaurs. And we evolved from dinosaurs.

Muslim Chicken: What do you mean by “we evolved”? What does evolution mean?

Science Chicken: It means that within species, the strongest and most adapted organism always survives and produces a new species.

Muslim Chicken: So, are you saying that we are now stronger and more adapted than a Tyrannosaurus? Are you saying that we evolved from a Tyrannosaurus into a chicken?

Science Chicken: Yes, exactly.

Muslim Chicken: So now you are saying that this mechanism has always existed; that these lifeless substances randomly experimented until they formed a mechanism whose probability of discovering by chance was scientifically impossible, and that this design, with every one of its parts serving a purpose, built itself. Then these same lifeless substances randomly experimented until they formed a cell, whose probability of discovering by chance was scientifically impossible, and then this cell became a dinosaur, and then it transformed into a chicken, a living creature stronger and more adapted than the dinosaur. Is that what you are saying?

Science Chicken: Yes.

Muslim Chicken: You are insane.

If there is anyone bold enough to say, despite such clear evidence, that Allah cannot be the cause of all this motion, then please, let him come forward and give us one example, just one, and say, “Look, this is how it happens here, and the same thing happens in atoms and planets,” thereby explaining what physics cannot explain. Otherwise, objections can only amount to dishonesty.

Aristotle, in his work *Metaphysics*, lists four causes that explain existence and that must be distinguished from one another:

Material Cause (Kind/Matter): What something is made of (for example, the bronze of a statue).

Formal Cause (Form/Structure): What something is, its design or definition (for example, the shape of the statue).

Efficient Cause (Mover/Agent): The power that brings something into existence or sets it in motion (for example, the sculptor).

Final Cause (Purpose/Aim): The purpose for which something is made or exists (for example, to be exhibited or worshipped).

If the notion that the efficient cause and the material cause are completely different is not understood, and the matter is evaluated without knowing this distinction, we fall into the grave error of treating the efficient cause and the material cause as one and the same.

We call the identification of the efficient cause with the material cause atheism and agnosticism. “Why is this marble in the shape of a human being?” “Because the marble has such a property.” “How did this living being come into existence?” “Because atoms have such a property,” says atheism and agnosticism.

Where in the atom is the property that enables a planet to revolve in an orderly orbit for billions of years? Where in the atom is the property that enables a moon to remain in orbit for billions of years?

What exists in the atom is “repulsion” and “attraction.” We do not even discuss how repulsion and attraction came to exist. We simply know that they exist. But there is no explanation for what causes the orderly and continuous motion to be maintained.

What is the cause that maintains the orderly and continuous motion in the atom?

Something cannot be both existent and nonexistent at the same time. If there is even a single piece of evidence for the existence of something, its nonexistence becomes impossible.

The moment we say, “My kidney exists for a purpose,” atheism, agnosticism, and all God-denying schools of thought collapse.

Does the human eye have a purpose? Yes.

Does the human ear have a purpose? Yes.

Does the human kidney have a purpose? Yes.

Does the human liver have a purpose? Yes.

Do the human hand and arm have a purpose? Yes.

When we remove an organ from the human structure, does the system collapse? Yes.

Then can we say that every part has a purpose? Yes.

How, then, can a being whose every part has a purpose itself have no purpose?!

Where there is design, there is purpose. Purpose, in turn, is a sign of consciousness, awareness, intellect, and knowledge. (The Creator)

The non-believing view says: “It appears that human beings have a purpose, but this does not originate from consciousness; it results from adapting to the environment over millions of years (the claim of evolution).”

If that is truly the case, then why would evolution cause the cell to evolve into a creature capable of reasoning? It should instead have produced a super-creature like an animal, possessing no intellectual consciousness, yet having biologically superior features

in every respect: one that runs faster, flies faster, swims faster, and is immensely strong, like a robot.

We know that animals have advantages over us. Some are extremely fast, some are extremely strong, and some can fly. They are, in certain respects, superior to us, and they are also far more adapted than we are. Atheism, evolution, and agnosticism all acknowledge this. If the situation is as such, then there cannot actually be something that necessitates the evolution of animals into human beings.

For a mind capable of reasoning, atheism, the theory of evolution, agnosticism... all of them have now collapsed.

Science also proves that human beings cannot have come about randomly, yet no one tells people about this.

The probability of a living cell coming into existence in a balanced and functional form, together with its DNA code forming in an orderly manner, is “1 in $10^{300,000}$.” This is merely the probability of a single cell coming into existence randomly.

Completing $10^{300,000}$ attempts would take almost infinitely longer than the current age of the universe, which is 13.8 billion years, even if physical limits were pushed to their extremes.

At the smallest unit of time in the universe, the Planck time (10^{-43} seconds), even if all the atoms in the observable universe (10^{80}) acted as though they possessed intelligence and consciousness, and all the atoms continuously attempted to form a

single cell simultaneously, the maximum total number of interactions that could have occurred since the Big Bang would be around 10^{120} . In that case, completing $10^{300,000}$ attempts would take approximately $10^{299,980}$ years.

Scientifically, the probability of a single cell coming into existence randomly is impossible, dear reader.

Pay attention: our calculation concerns only the probability of the entire universe attempting to form a single cell. Even if all the atoms in the universe had begun, since the Big Bang, to make random attempts to form a cell as though they possessed consciousness, they still could not produce the cell. If we call the period from the Big Bang to the present the “age of the universe,” then merely for a single cell to be randomly obtained, another 299,860 “ages of the universe” would have to pass.

Please try to understand, dear reader: this is only one cell.

The average adult human body contains approximately 30 to 37 trillion (3.7×10^{13}) cells. A single human cell contains approximately 6 billion base pairs (A, T, C, G).

The probability of the DNA sequence of a single cell being arranged randomly:

$4^{6 \times 10^9} \approx 10^{3,6 \text{ billion}}$, that is, approximately one chance in $10^{3,6 \text{ billion}}$ attempts.

The probability of all 37 trillion cells coming together entirely by chance:

$$(10^{3,6 \text{ billion}})^{(3.7 \times 10^{13})} \approx 10^{(1.3 \times 10^{23})}$$

This probability value is unimaginably greater than the total number of atoms in the observable universe (10^{80}).

Anyone who wishes may also multiply this number by the number of human beings who have lived throughout history, and additionally by the number of cells in all mountains, rocks, plants, and animals, and obtain an even greater improbability for random formation.

As we can see, the random formation of the universe is scientifically impossible, dear reader; we can prove this with certainty.

Those who put forward the claim of evolution may say that the cell did not appear all at once, but that self-replicating cells emerged over time through selection and accumulation. However, one must think carefully and realize that even the probability of lifeless and unintelligent matter producing even a single strand of DNA is one that would require far more attempts than the age of the universe allows. Furthermore, does selection and accumulation occur through the will of matter?

No.

It occurs randomly in the same way.

Therefore, whether the process produces the cell in a single event or produces it gradually through accumulation, the probability is ultimately subject to the same calculation of randomness.

If, despite this proof, someone still says, “There is no Allah,” that is up to them. The subject they did not want to understand in this world will certainly be taught to them in the Hereafter.

“Rather, those who disbelieve deny it. Yet Allah knows best what they conceal. So give them the good tidings of a painful punishment!”

(Surah al-Inshiqaq 84:22–24)

Compared with the language used in the first book, the language I have used here may be harsh and may feel like a slap in the face. However, sometimes a slap is necessary to awaken a person from the sleep of *ghaflah* (a state in which a person becomes deeply occupied with worldly affairs and forgets Allah, the Hereafter, and their spiritual responsibilities; the heart being asleep to the truth). It is better to awaken in this world than to awaken in the midst of eternal punishment in the Hereafter.

For this reason, dear reader, break your pride and your *nafs*. This is not about you or me, nor about your feelings or mine. It is about the existence and Oneness of Allah.

Whether you believe or do not believe, if your aim is to reach the TRUTH, then here we are opening a window together.

If you want to spend your life and die within your comfort zone, living according to fabricated truths, then good news!

In the Hereafter, a painful punishment awaits you!

SCIENTIFIC LAWS ARE NOT THE CAUSE OF MOTION THEY ARE MERELY LABELS

At present, almost the entire human population, including even people within Islam, are unaware of the fact that scientifically formulated laws are not the causes of the observed phenomena, but merely consist of giving the things people see and experience the name “scientific law.”

Let us take, for example, the “centrifugal force” mentioned in the previous section.

According to the concept of centrifugal force, it is not our definition of centrifugal force itself that causes the Earth to be flung outward!

In centrifugal force, we do not know why the object is thrown outward. We do not know, but we observe that it is thrown outward, and we put a label on this phenomenon called “centrifugal force.”

Likewise, the reason objects on Earth fall to the ground is not gravity. Objects on Earth fall to the ground when they are released. We do not know whether they are being pulled from below, or whether a force is pressing down on the object from above and bringing it closer to the center of the Earth.

People have observed that when an object is released, it moves toward the center of the Earth. They have named this movement “falling.” Then they have also given the name “gravity” to the supposed cause of this falling.

These names are NOT CAUSES; they are merely LABELS. The fact that, in some cases, a somewhat stronger cause-and-effect relationship is observed between certain events than between others, and that a name is given to part of the mechanism that has been observed, as in Kepler’s Laws, ultimately amounts to the same thing. It never explains the cause itself. It merely describes the part of the mechanism that can be observed.

It is also possible that the magnetic field caused by the rotation of the Earth is pushing objects downward from above toward the center. In other words, it could be not “gravity,” but “celestial pushing.”

Especially in schools of thought outside Islam, such as atheism and agnosticism, scientific laws are presented as the causes of observed phenomena. However, it must be distinguished that the laws themselves cannot be causes.

I repeat this again and again because understanding this distinction is critically important.

When speaking with someone who does not believe, for example, if you ask, “Why do eggs not grow on trees, while eggs are laid only by chickens?” the answer will generally be, “Because

chickens lay eggs; that is the law of nature.” Yet this does not explain the reason.

However, Islam explains the cause that materialism cannot explain.

In Islam, the reason for the existence of everything that is created can only be attributed to a single power that is above everything and independent of everything. If Allah willed, He could have made eggs come from trees and apples come from chickens. In that case, if there were a human being who had seen from the moment of his birth that eggs were a food that grew on trees, then, to that person, it would also seem impossible and meaningless for an egg to come from a chicken.

A human being can define and comprehend his surroundings only to the extent of his experiences. Many of the problems we face today also arise from ignoring this reality.

In essence, everything we see around us, the night, the day, animals, plants, the birth and growth of a baby, atoms continuing to form matter continuously and regularly without dispersing... is a miracle. However, human beings are exposed to so many miracles from the moment they are born that this becomes a habit for them. This is called *ulfah*.

A person living in *ulfah* is, so to speak, like a zombie numbed under the influence of matter. Instead of interpreting his surroundings, the brain chooses what is easiest, namely its comfort zone. He does not want to learn anything new. He keeps rushing

after very basic, elementary needs, almost like a sluggish zombie moving forward saying, “Brainzzzz.”

If a person does not awaken from this sleep of ghaflah and tear apart the veil of ulfah, if he does not step back and look at his surroundings objectively, and if he does not reach this potential, then neither can you establish healthy communication with such a person nor can you expect him to understand what is being explained. Because, in order for a subject to be understood, there must first be a foundation capable of understanding that subject.

(Consider, for example, how in ancient times people who lacked the necessary intellectual and scientific foundation to understand a solar eclipse assumed, when the Sun was eclipsed, that God was angry with them.)

For this very reason, if two people are arguing about an issue, first both sides must possess the same level of knowledge about the subject of the discussion and the same potential to give meaning to it.

For example, when a couple is arguing over a Sunday breakfast that the man does not want but the woman very much wants, if, according to the man, breakfast means nothing more than filling one's stomach, whereas for the woman it represents love, attention, and communication, then this argument will never come to an end.

In order to reach an understanding, the meanings and significance of things must mean the same thing to both sides.

In discussions concerning matters of faith, this distinction is likewise an indispensable necessity. If one person uses the words “truth” and “reality” in their proper meanings, while the other person considers the words “truth” and “reality” to express the same thing, healthy communication cannot be established.

A condition that can be perceived through the senses is a reality; truth, however, is the absolute concept that transcends

everything. When viewed on the micro scale of an individual human being, it is a reality that the world beneath a person walking along a road does not appear to be moving. However, the truth is that the Earth is moving both around its own axis and through the expanse of space.

In light of the explanation given above, for a person who cannot see the Essence of the Creator with their eyes, the fact that the Essence of the Creator cannot be seen is a reality.

However, the truth is that the Creator exists.

A person who wishes to attain the “truth” must first establish the necessary foundation for it; this is an unavoidable necessity, dear reader. Otherwise, the person will attempt to dismiss what is being explained merely through meaningless denials such as, “CIX, that’s not how it is!”, or “Of course, you’re the one who knows everything!”, or by choosing the option most comfortable for their inner emotional state: by running away, creating empty noise, attempting to manipulate, struggling to prove themselves right, desperately resisting, perhaps even insulting, belittling, or attempting to drag the other person down...

Far from being able to exchange knowledge with such a person on common ground or reach agreement on any point, that person may perhaps never even think about, or be able to think about, what has been explained.

“I DON’T BELIEVE IN WHAT SCIENCE CANNOT EXPLAIN!”

Most people, especially atheists, accept science not as a method, but almost as a religion. Science, experiment, and observation are merely methods. They are only some of the ways that can be used to understand the world around us. Therefore, when a person rigidly says, “I will believe it if science can explain it, but I will not believe it if science cannot explain it,” this does not lead that person to the truth. On the contrary, it ties that person’s hands and feet from the very beginning and severely restricts them.

Restricting oneself to the scientific method alone in order to understand one’s surroundings is like insisting on cooking every kind of food using only one method. Just as it is wrong for someone to say, “Every dish can only be made by frying,” it is equally wrong to say, “Reality can only be reached through the scientific method.”

Atheist:

“Well, I fry eggs in oil, and they turn out great. I fry meat in oil, and it turns out great. I fry vegetables in oil, and they are perfectly edible.”

Muslim:

“But there is also something called rice pudding.”

Atheist:

“I don’t believe that something called rice pudding exists.”

Muslim:

“What do you mean? You don’t think there is such a thing as rice pudding?”

Atheist:

“No. There can be no such thing as rice pudding. Can you fry the milk, rice, and sugar?”

Muslim:

“No, we can’t fry them.”

Atheist:

“See? There is no rice pudding.”

Muslim: “WHAAAAAT?!?”

To say, “I will accept the existence of Allah, the Hereafter, the angels, and the jinn if science explains them; if science does not explain them, I will not believe in them,” is precisely the same as this tragicomic situation.

As we mentioned at the beginning of the previous section, in order for something to be considered scientific, it must be experimentally testable and observable. Therefore, we cannot arrive at the existence of the Hereafter, the angels, or the jinn through the scientific method. We have to use another method to understand these things. We have to make use of reasoning and logical inference, as well as contemplation and reflection. (Temaşa means looking at, observing, or contemplating something carefully, attentively, deeply, and with appreciation.)

To give another example, limiting one's faith only to what science can explain and what one's eyes can see is just like a person denying the existence of the Andromeda Galaxy (M31) simply because they cannot see it with the naked eye.

The Hereafter and the angels are like the Andromeda Galaxy in the example above. They cannot be seen with the naked eye (that is, through the scientific method). They can be seen and understood through the method of the telescope (that is, through contemplation and reflection, and through the methods of reasoning and logic). Therefore, saying, “I will believe only if science shows it to me,” leads a person into error.

Is morality objective and true?

Science cannot measure this.

Are the rules of logic valid?

Science cannot verify them through experiments, yet we do not deny their existence.

You cannot put a metal detector into water and say, “I couldn’t find any fish, therefore fish do not exist.” The problem is that the wrong tool is being used.

A thermometer cannot be used to measure a person's height. One cannot say, "I cannot measure a person's height with a thermometer; therefore, there is no such thing as height."

Mistaking the limits of what science can examine for the limits of what actually exists is a serious logical error. If science cannot examine something, this does not mean that the thing does not exist; it means that it does not fall within the scope of scientific investigation.

Moreover, in the previous chapter, we also proved the existence of Allah through the scientific method. Once the existence of Allah has been established, we have, by extension, also established everything contained in the Book sent down by Allah. For whatever Allah describes in the Qur'an exists exactly as He describes it. Likewise, angels, prophets, jinn, and magic all exist. In this way, all of those fabricated beliefs such as "I believe in God, but I do not believe in the prophet," "I believe in God, but I do not believe in the Book," and "I believe in the Qur'an, but I do not believe in angels" are all invalidated.

To regard the methodological limits of science as a general ontological limit is a colossal category error, dear reader.

AISHA, THE DAUGHTER OF ABU BAKR, WAS NOT A CHILD WHEN SHE MARRIED

Those who seek to cast a stain upon Islam, or directly upon the Messenger of Allah (PBUH), by claiming that Hz. Aisha was a child when she married cannot produce conclusive evidence for this claim.

There is only one chain of transmission upon which their claims are based, namely that of the Medinan narrator Hisham ibn Urwah. Hisham moved to Iraq (Baghdad) during the final years of his life and, as stated by historians and hadith critics (such as Imam Malik), suffered from memory loss and confusion (*tadlīs*). He transmitted this specific age detail in Iraq during his old age, although he had never mentioned it during his time in Medina. Therefore, this source has no reliable basis.

Furthermore, the Medinan narrators who transmitted the same event did not report Hz. Aisha's age in this manner.

Nevertheless, there is a great deal of evidence indicating that Hz. Aisha was not a child.

1. Comparison of Her Age with Her Sister Hz. Asma

There are two fundamental pieces of information upon which Islamic historians and scholars of biography (*Sīrah*/*Ṭabaqāt*) agree:

Hz. Asma was 10 years older than Hz. Aisha.

Hz. Asma died in the 73rd year after the Hijrah at the age of 100 (Ibn Abd al-Barr, *al-Istī'āb*; Ibn Kathīr, *al-Bidāyah wa'l-Nihāyah*; al-Mizzī, *Tahdhīb al-Kamāl*).

Therefore, at the time of the Hijrah:

$$100 - 73 = 27$$

Hz. Asma was 27 years old.

Since Hz. Aisha was 10 years younger than her sister, she would have been:

$$27 - 10 = 17$$

years old at the time of the Hijrah.

Since her marriage to the Messenger of Allah (PBUH) took place approximately 1–2 years after the Hijrah, she would have been approximately 18–19 years old when she married.

2. Her Place in the List of the First Muslims

In the works of Ibn Ishaq and Ibn Hisham, *al-Sīrah al-Nabawīyyah*, the names of those who embraced Islam in Makkah during the early days of Islam are presented in chronological order. Hz. Aisha appears among the *Sābiqūn al-Awwalūn* (“Those Who

Were Among the Foremost to Embrace Islam”), before Hz. Umar embraced Islam in the sixth year of Prophethood and before the period of the gatherings at the house of Ibn Arqam.

For a person to consciously and intentionally be regarded as having embraced Islam, that person must have reached an age of understanding and awareness.

Even if we assume that she was 5–6 years old in the early years of Prophethood, around 610, she would have reached approximately 18 years of age by 624, the year of her marriage.

If the narration stating that she was nine years old were correct, she would necessarily have been a baby when she embraced Islam, which is chronologically highly implausible.

3. Her Ability to Remember and Comprehend Qur'anic Verses

In a narration recorded by al-Bukhari, Hz. Aisha says:

“I was a girl playing in Makkah when the verse, ‘Rather, the Hour is their appointed time, and the Hour will be more grievous and more bitter,’ (Surah al-Qamar, 46) was revealed.”

Surah al-Qamar was revealed in the 4th or 5th year of Prophethood (approximately 613–615).

For a child to witness the revelation of a verse and remember the events and the verses in detail, she would have needed to be at least 5–7 years old.

Hz. Aisha, being 6 years old in 613, would therefore have been approximately 17–18 years old at the time of her marriage in 624.

4. Hz. Aisha's Previous Engagement

According to records found in Ibn Sa'd's *al-Ṭabaqāt al-Kubrā* and Ahmad ibn Hanbal's *Musnad*, before her *nikāh* with the Messenger of Allah (PBUH), Hz. Aisha had been engaged or promised in marriage to Jubayr ibn Mut'im, the son of Mut'im ibn Adiyy, one of the prominent figures of Makkah.

The polytheist family of Mut'im broke off this engagement, citing the beliefs of the Muslims as the reason.

Even in the society of the *Jāhiliyyah*, young girls who had not yet reached marriageable age were not engaged and given in marriage as brides.

This event clearly demonstrates that she was already a young woman of marriageable age, meaning that she had reached *rushd*, before the Messenger of Allah (PBUH).

5. Her Participation in Military Expeditions

According to narrations in *Sahih al-Bukhari* and *Sahih Muslim*, Hz. Aisha was among those who went to the battlefields of Uhud and Badr, carrying water to the wounded and providing nursing and medical assistance.

The Messenger of Allah (PBUH), due to the grave dangers of warfare, did not allow boys younger than 15 years of age to participate in military expeditions, turning back, for example, Ibn Umar and Zayd ibn Thabit.

Participation in the harsh conditions and logistical duties of a battlefield would be impossible for a nine-year-old child. This indicates that she was physically and psychologically a mature woman.

There are also two fundamental scholarly explanations regarding the narration found in the hadith collections, including Sahih al-Bukhari and Sahih Muslim, stating that she was six years old at nikāh and nine years old when the marriage was consummated.

The first concerns the Arabic convention of expressing numbers. (Example omitted.) Among the Arabs, it was a common linguistic practice to omit the tens digit and mention only the units digit. For example, saying only “9” instead of “19” was possible as a linguistic convention. Accordingly, the expression “9” could refer to the age of 19.

The second explanation concerns the practice of beginning the counting of age after bulūgh (puberty) had been reached. Among the Arabs, the age of girls could be counted beginning after they entered the age of puberty and rushd (maturity). From this perspective, the ninth year after reaching bulūgh would correspond to an overall age of approximately 18–19 years.

As can be seen, Hz. Aisha was not a child when she married.

Nevertheless, despite possessing no definitive historical evidence establishing that Hz. Aisha was a child, certain anti-Islamic approaches take a single narration, transmitted by a mind whose reliability and consistency they claim had deteriorated, and dogmatically rely upon it before attempting to construct a moral accusation from it. This is by no means a scientific approach.

If a person rejects Islamic sources entirely, yet, precisely when this subject arises, imagines that he has found an opening and desperately clings to a single narration, this cannot be called scientific consistency. It is called inconsistency.

Therefore, describing Hz. Aisha as a “child bride” while presenting oneself as modern, on the basis of unfounded claims, is nothing more than anachronism: the attribution of an event, person, object, or concept to a period of history with which it is incompatible, in other words, a chronological error or temporal incongruity.

THE MARRIAGES OF PROPHET MUHAMMAD (SAW) WERE NOT MOTIVATED BY SEXUAL DESIRE

Having to explain this matter at all is enough to weigh heavily upon one's heart. Nevertheless, there must be no room left for doubt in people's minds. Therefore, let us also clarify this issue.

Of the 11 wives of Prophet Muhammad (SAW), only one, Hz. Aisha, was married at a young age; all of the other 9–10 wives were widows, and most of them were in their 30s or 40s. It is important to understand that the Prophet (SAW) was a leader and that these marriages carried very significant political meanings in the society of that time.

At that time, tribalism was prevalent. A person who belonged to a tribe had both status and protection. If a person had no tribe, they had no protection either. This meant that such a person would become weak and vulnerable within society and would be unable to defend their rights against others.

The stronger and more respected a person's tribe was, the stronger and more respected that person would be. Someone whose protection was withdrawn by their tribe would be pushed into a vulnerable and disadvantaged position, much like a person today who is not recognized as a citizen by any state and therefore has no state protection.

For this reason, establishing marital ties with different tribes had enormous political significance. When we look carefully, we see that the multiple marriages of the Prophet (SAW) at that time established ties with different tribes and prevented those tribes from taking steps against Islam. Because after such a marriage, if members of that tribe displayed hostility toward Hz. Muhammad (SAW), it would create an internal tribal conflict and could leave them weaker and more vulnerable in relation to other tribes.

Prophet Muhammad (SAW) married for the first time at the age of 25, to a widow, Hz. Khadijah, who was 15 years older than him, and he did not marry anyone else while she was alive. From the age of 25 to the age of 50, that is, during the age range that could most conventionally be regarded as the period of strongest sexual desire, he remained monogamous.

All of his subsequent multiple marriages took place after the age of 53, during the final 10 years of his life. If Prophet Muhammad's (SAW) motivation for marriage had been sexual desire, would it not have been more consistent for the women he married to have been young?

Prophet Muhammad (SAW) married Hz. Khadijah bint Khuwaylid, as we mentioned. At the time of their marriage, Hz. Khadijah belonged to the Asad ibn Abd al-Uzza clan of Quraysh. Since this marriage took place before Prophethood, we may consider that it did not have a political purpose.

After the death of Hz. Khadijah, when he was approximately 50 years old, he married Hz. Sawdah bint Zam'ah.

Hz. Sawdah was a widow and was approximately 55 years old at the time of the marriage. She belonged to the Amir ibn Lu'ayy clan of Quraysh. This marriage, following the death of her husband and her return from Abyssinia, was intended to provide protection and care for Hz. Sawdah, who had been left without family support or protection. At the same time, it is interpreted as a social gesture that strengthened solidarity among the early Muslims.

During this period, he also contracted nikāh with Hz. Aisha bint Abi Bakr. The Prophet (SAW) was approximately 52–53 years old at the time of the nikāh and approximately 55 at the time the marriage was consummated. Hz. Aisha belonged to the Taym clan of Quraysh. This marriage established a family relationship with Hz. Abu Bakr, his closest companion in the cause and the future first Caliph.

At approximately 56 years of age, he married Hz. Hafsa bint Umar. Hz. Hafsa was a widow and belonged to the Adi clan of Quraysh. This marriage established a family relationship with Hz. Umar, a powerful companion in the cause, while also providing protection and care for Hz. Hafsa, whose husband had died following the Battle of Badr.

At approximately 57 years of age, he married Hz. Zaynab bint Khuzaymah. Hz. Zaynab was a widow and was known by the title "Mother of the Poor." She belonged to the Hilal tribe, a branch of the Amir ibn Sa'sa'ah tribe. Her husband had been martyred at the Battle of Uhud, and this marriage, undertaken after Hz. Zaynab had been left without protection, served both as an expression of

social solidarity and as a means of establishing ties with the Hilal tribe.

At approximately 58 years of age, he married Hz. Umm Salamah, whose actual name was Hind bint Abi Umayyah. Hz. Umm Salamah was also a widow and belonged to the Makhzum clan of Quraysh. Following the death of her husband, Abu Salamah, she was left with young children and without protection. Providing protection and care for Hz. Umm Salamah was a prominent aspect of this marriage; it also strengthened relations with the powerful and influential Makhzum clan.

Around the same period, at approximately 58 years of age, he married Hz. Zaynab bint Jahsh. Hz. Zaynab had previously been married to Zayd ibn Harithah, the adopted son of the Prophet (SAW), and had become a widow after their divorce. She was approximately 35 years old at the time of the marriage. She belonged to the Asad ibn Khuzaymah clan of Quraysh and was also the Prophet's (SAW) cousin through his paternal aunt. It is stated that this marriage served to practically demonstrate the ruling abolishing the institution of adoption as understood in the pre-Islamic sense and to personally break the social taboo inherited from the Age of Jahiliyyah that "one cannot marry the former wife of one's adopted son." In this respect, it served a social reform function.

At approximately 58 years of age, he married Hz. Juwayriyyah bint al-Harith. Hz. Juwayriyyah was a widowed woman who had been taken captive during the Expedition of Banu al-Mustaliq and belonged to the Mustaliq tribe, a branch of the

Khuza'ah tribe. Following this marriage, hundreds of Mustaliq captives held by the Muslims were released on the grounds that they had become "relatives of the Prophet." This resulted in the entire tribe embracing Islam; the sources mention this as a marriage that produced a direct political and social consequence.

At approximately 59–60 years of age, he married Hz. Umm Habibah, whose actual name was Ramlah bint Abi Sufyan. Hz. Umm Habibah was a widow and belonged to the Umayyad clan of Quraysh. Her father, Abu Sufyan, was at that time the most powerful leader opposing the Muslims in Makkah. This marriage is interpreted as a strategic step aimed at establishing a connection with the opposing camp, facilitating the conquest of Makkah that would later take place, and softening Abu Sufyan's attitude toward Islam.

At approximately 59–60 years of age, he married Hz. Safiyyah bint Huyayy. Hz. Safiyyah was a widowed woman who had been taken captive during the conquest of Khaybar. She belonged to the Nadir tribe, a Jewish tribe, and is considered to have descended from Hz. Harun. This marriage is stated to have served the purpose of easing relations with the Jewish community of Khaybar after its conquest, directing them toward integration rather than hostility, and strengthening social peace.

Finally, at approximately 60 years of age, he married Hz. Maymunah bint al-Harith. Hz. Maymunah was also a widow and belonged to the Hilal tribe, a branch of the Amir ibn Sa'sa'ah tribe. This marriage is interpreted as strengthening relations with the tribes around Makkah and supporting the process of peace. It is also

stated that, because it took place during Umrat al-Qada, the compensatory Umrah performed in the 7th year after Hijrah, in the month of Dhu al-Qi'dah, by Hz. Muhammad and his Companions in accordance with the Treaty of Hudaibiyyah after the polytheists of Makkah had prevented them from completing the Umrah the previous year, it contributed to the process of reconciliation with the polytheists of Makkah.

In addition, Hz. Mariyah al-Qibtiyyah, who was presented as a gift by al-Muqawqis of Egypt, should also be mentioned. She was not with the Prophet (SAW) through nikāh, but in the status of a female slave, and she became the mother of his son Ibrahim. For this reason, she is not counted among his "wives" in some sources. It is also stated that her presence carried symbolic significance in the context of strengthening relations with Egypt.

It is also necessary to evaluate the Prophet (SAW) within the conditions of the period in which he lived and the circumstances into which he was born.

The Prophet (SAW) was not in a position comparable to a modern government employee who goes to work for eight hours a day and then returns home. Every second of his life, he was engaged in spreading Islam and serving as an example to those around him, while at the same time, so to speak, personally attending to every responsibility. He was continuously governing the Islamic state like a head of state; continuously carrying out major reforms; constantly raising and educating people like a teacher; receiving revelation and having those revelations continuously written down by the few people of that time who knew how to read and write; teaching the

verses and the newly revealed rulings; establishing places that functioned as mosques and madrasahs; personally visiting and supervising these places; while at the same time personally taking up the sword and fighting those who showed hostility toward Islam. He was also the Imam of the entire community. Just as he led the prayers morning and evening, he himself was continuously engaged in worship, performing prayers during both the day and the night in his home.

In addition to all these realities, even the people of his own time, including so many enemies who personally wished to harm him and who would have drowned him in a cup of water if they had found the opportunity, called him Al-Amin, "the Trustworthy," and could not deny his noble character. Even the polytheists trusted him unconditionally in their affairs. If they had truly witnessed any form of deviance in him, do you think they would have left the matter for people in your time to discover? Would they not have shouted it from every street and made it known to everyone immediately?

Please try to imagine all of this realistically. Without telephones, computers, infrastructure, media, airplanes, or cars, would a human being have the physical capacity to manage and constantly supervise all of these responsibilities alone?

You are 50–60 years old. Even your enemies call you Al-Amin. All those enemies are constantly searching for a weakness in you, yet they cannot find even a single instance of deviance concerning you. And despite all these realities, you are going to claim that your marriages were motivated by sexual desire?

There is not even a possibility for such a situation to exist, either anatomically or psychologically.

If there is still anyone who stubbornly claims that the marriages of the Prophet (SAW) were driven by lust and deviance, then I say this to you:

If such a thing had truly existed, Abu Jahl and Abu Lahab, who were both highly intelligent and extremely hostile toward Prophet Muhammad (SAW), would not have left such absurd allegations for you to make today.

THE PHARAOH'S PRESERVED BODY

Then We carried the Children of Israel across to the other side of the sea. Pharaoh and his army pursued them unjustly and aggressively. Finally, when Pharaoh was about to drown, he said: "Indeed, I have believed that there is no deity except the One in whom the Children of Israel have believed! I am also now among those who submit themselves to Him."

(Yunus 90)

"Now? Whereas before, you had always rebelled and been among the corrupters."

(Yunus 91)

"So today We shall save your body, so that you may be a lesson for those who come after you. Yet indeed, many among mankind are unaware of the signs We have shown."

(Yunus 92)

There is a group of people on the internet who claim that this body does not belong to Pharaoh, but rather to an ordinary villager.

Let me mention some facts for readers who use reason, and leave it to each person to believe or not to believe.

First of all, it must be acknowledged that there is neither “I am Pharaoh” nor “I am a villager” written on this body’s head. Let us examine the matter together from an objective point of view.

The Holy Qur’an states that Pharaoh fell into prostration (sujūd) while drowning in the water. Therefore, if the body belongs to Pharaoh, it should be in a state of prostration.

Is the body in a state of prostration?

Yes.

According to a scientific article published in the Journal of Archaeological Science, carbon testing was conducted on hair samples taken from this mummy, and it was determined with certainty that the mummy dates to between 3351 and 3017 BC. (Natural mummies from Predynastic Egypt reveal the world's earliest figural tattoos, Renée Friedman et al.)

In Ancient Egypt, the concept of the Pharaoh and the period of the Egyptian Kingdom began around 3100 BC. This date marks the political unification of Egypt with the beginning of the First Dynasty. Before this date, Egypt consisted of two separate kingdoms: Upper Egypt in the south and Lower Egypt in the north.

King Narmer, who is also referred to as Menes in some sources, united these two regions under a single rule through warfare and established Egypt’s first dynasty. The use of the title “Pharaoh” and the administrative system of pharaonic rule also began around this period.

When we compare these dates, do the period of Prophet Moses, the period in which the Pharaohs existed, and the period to which this body belongs fall within the same general time frame?

Yes.

The Holy Qur'an states that Pharaoh drowned in the Red Sea. Therefore, the body that is to be found should also have been found in the Red Sea. So, was this body found in the Red Sea?

Yes.

When we examine the characteristics of this body, we see that:

It is in a state of prostration!

It has been naturally preserved. (There has been no human intervention.)

It was found in the Red Sea.

It belongs to the period of Prophet Moses and the Pharaohs.

The skin, hair, and soft tissues have been completely preserved.

The internal organs have not been removed.

There is no evidence of chemical embalming.

It has remained preserved without deteriorating until the present day.

We are therefore confronted with a body that remained in a state of prostration in the Red Sea, with its internal organs intact, without artificial embalming, and preserved without deterioration, in a manner that corresponds exactly to what the Holy Qur'an describes, and for which there is no comparable example.

When all these pieces of evidence are considered, all the evidence and all the signs confirm the Qur'an.

If there is even one other example of a body from 5,000 years ago that has reached the present day without being embalmed, preserved exactly as it was, from its hair to its eyes, and lying in prostration, then please show it to us, dear reader.

THE MELTING POINT OF PURE SILVER

One of the scientific data we have observed is that the melting point of pure silver is 962 °C (degrees Celsius). Silver changes from a solid state to a liquid state at 962 °C. The determination that the melting point of pure silver is 962 °C is a relatively recent scientific achievement.

Until the end of the 19th century, there were no instruments capable of accurately measuring very high temperatures (pyrometers). The melting point of silver could only be determined precisely through the optical pyrometry and thermoelectric thermometer techniques developed in the late 19th and early 20th centuries.

During this period, the melting point of silver was also adopted as a reference (fixed) point for calibrating temperature scales. It was accepted as a reference point in the International Temperature Scale adopted in 1927.

In short, defining the melting point of pure silver with a value as precise as 962 °C only became possible with modern thermometry and pyrometry techniques in the late 19th and early 20th centuries, particularly around 1927.

The first verse in which the word “silver” appears in the Qur’an is:

“Women, children, heaped-up stores of gold and silver, branded horses, cattle, and crops are made appealing to people as

worldly desires. These are the enjoyments of the life of this world. But with Allah is the best place to return.”

(Āl ‘Imrān, 3:14)

The verse that describes the melting/heating of silver in the Qur’an is:

“On the Day when they will be heated in the Fire of Hell, and with them their foreheads, sides, and backs will be branded. It will be said to them: ‘This is what you hoarded for yourselves. So taste what you used to hoard!’”

(At-Tawbah, 9:35)

So, how many verses are there between the first verse in which the word “silver” appears in the Qur’an and the verse describing the heating of silver?

962.

The Messenger of Allah (peace and blessings be upon him), who was a Prophet between 610 and 632, was unable to read or write. In the Age of Jāhiliyyah in Arabia, an illiterate person, over a period of 23 years, conveyed the verses revealed in response to events and circumstances encountered, even though these verses were not revealed in chronological order but in a seemingly mixed sequence.

Despite this, we see that there is such a miracle concerning silver, and that we were only able to discover it many years later.

Thus, we can plainly see, with demonstrable evidence, that no society living at that time could possibly have known that the melting point of silver was 962 °C.

Anyone who wishes may say that it was merely a “coincidence,” for such a fact does exist.

If you notice, Islam continually brings forth logical and scientifically verifiable facts for which the probability of coincidence can be regarded as mathematically impossible, while minds that do not wish to believe continually say, “It was a coincidence,” “It happened by chance,” or “It happened by itself.” And, on top of that, they describe Islam as “dogmatic.”

Atheism is dogmatic.

A mentality that accepts something as it is, without questioning it, from the outset, and from a narrow perspective, is the mentality of atheism.

Islam does not accept what it has neither seen, proven, nor reasoned through. Indeed, the Qur’an repeatedly contains expressions such as, “Will you not reason?” and “Will you not reflect?” A Muslim sees Allah and believes in Him accordingly. Seeing Allah does not mean seeing His Divine Essence alone. One may also recognize Him by seeing His art and by recognizing His attributes.

Just as, when we look at a telephone, even though we do not see the engineers who made it, we can understand that the engineers behind it must exist by considering circuit design, power management, EMI/EMC, antenna principles, computer

architecture, embedded systems, microprocessors, bus systems, operating systems, driver development, UI/UX, mobile software architecture, thermal management/heat dissipation, mechanical design, durability/drop testing, CAD/CAM, semiconductors, polymers, glass technologies, thermal conductivity, 5G/6G protocols, RF design, signal processing, wireless communications, camera sensors, lens designs, image processing, the refraction of light, nanometer-scale chip manufacturing, CMOS, lithography, wafer processes, lithium-ion/solid-state battery chemistry, coating technologies, supply chains, mass-production lines, quality control, cost optimization, sensor integration, vibration motors, actuators, microphone/speaker architecture, noise cancellation, and digital signal processing.

Likewise, when the design, construction, and sustainability of a planet, its ecosystems, and the universal order are taken into consideration, we are compelled to acknowledge the existence of a Creator possessing, in terms of creative and originating power, infinite knowledge (knowing all things), absolute power (unlimited power), pre-eternity and post-eternity (being beyond time), transcendence of time and space, absolute will (the authority to choose and shape), the ability to design (Musawwir), the power of creation (Khāliqiyyah), the power to establish mathematical and physical equations, absolute dominion over matter and energy, the ability to make precise adjustments on both the microscopic and macroscopic scales, the ability to manage the balance between chaos and order, continuity and preservation (Qayyūmiyyah), mastery over biochemical and genetic coding, the management of ecological balance and cycles, control over thermodynamics and field mechanics, purposefulness and the ability to establish purpose and wisdom (Hikmah), and absolute independence (existing by Himself and having no need for anything).

This is how Islam shapes belief in such a comprehensive and rational manner, while atheism confines itself within a narrow and closed box by saying, “Everything either came into existence by itself or happened by coincidence; I accept only the observable reality within the scope of what science can examine, and I categorically deny everything else,” and thereby continues to contradict itself.

THE PROPORTION OF WORDS MENTIONED IN THE QUR'AN

The numbers of the words occurring in the Qur'an are, incredibly, either parallel to or proportionate to one another.

Some researchers may arrive at different numbers by evaluating the roots of words from different perspectives. However, in general, the numbers below are directly found within the Qur'an. The numbers generally accepted without dispute are as follows.

The word *Dunya* occurs 115 times, while the word *Akhirah* also occurs 115 times.

The word *Angel* (*Mala'ikah*) is repeated 88 times, while the word *Satan* (*Shaytan*) is also repeated 88 times.

The word *Paradise* (*Jannah*) occurs 77 times, and the word *Hell* (*Jahannam*) also occurs 77 times.

The word *Man* (male) occurs 24 times, and the word *Woman* (female) also occurs 24 times.

Maghfirah, meaning forgiveness, occurs 234 times, while punishment occurs 117 times, half the number of occurrences of *Maghfirah*, because Allah's forgiveness surpasses His wrath.

The word *Life* (*Hayat*), expressing vitality, occurs 145 times, while its opposite, *Death* (*Mawt*), also occurs 145 times.

The word Month (Shahr) occurs 12 times.

The word Day (Yawm) occurs 365 times.

The word Days (Ayyam and Yawmayn) occurs 30 times.

The word Iman, indicating the state of belief, occurs 25 times, while Kufr, indicating disbelief, also occurs 25 times.

The word Sun (Shams) occurs 33 times, while Light (Nur), which illuminates the night, also occurs 33 times.

Justice (Qist) and Oppression (Zulm) each occur 15 times.

The imperative “Say” (Qul), through Allah’s address, and “They said” (Qalu), used for angels, human beings and jinn, occur an equal number of times, 332 times each. (The first word of verse 21:112 is “Qul”, not “Qala”. In some copies of the Qur’an, it is mistakenly written in the form “Qala” meaning “he said.”)

There is scholarly agreement among Islamic scholars regarding the words and numbers given above. However, regarding the words and numbers I will mention below, there is no complete consensus because there are different interpretations depending on which word roots are accepted. Nevertheless, I still wish to mention them because it is possible to arrive at these numbers through a reasonable interpretation and analysis.

The expression “seven heavens” (sab‘a samawat) occurs 7 times, corresponding to the number of the heavens.

Iblis occurs 11 times, while isti‘adhah, meaning “seeking refuge in Allah,” also occurs 11 times.

War (harb) occurs 6 times, and captive (asir) occurs 6 times.

The substances from which human beings are created, “nutfa” and “tin,” meaning soil, each occur 12 times.

The word Salat (prayer), including its derivatives, occurs 99 times, corresponding to the number of the Asma al-Husna, the Most Beautiful Names of Allah.

Pharaoh (Fir‘awn) is mentioned 74 times. In contrast, sultan occurs 37 times, and ibtila’, meaning trial or test, occurs 37 times, making a total of 74 occurrences in the Qur’an. In other words, this points to the idea that Pharaoh was a sultan who was subjected to a test.

Patience (sabr) occurs 12 times, while distress (difficulty) occurs 12 times.

Abrar, meaning the righteous, occurs 6 times, while ashrar, meaning the wicked, occurs 3 times.

The names of 27 Prophets are repeated 513 times, while the word Messenger (Rasul), including its derivatives, is mentioned 513 times.

Rahmah (mercy) occurs 79 times, while guidance (hidayah) occurs 79 times, indicating that guidance is a manifestation of Allah’s mercy.

Treachery (khiyanah) occurs 16 times, while khabith, meaning wicked or impure, occurs 16 times.

Zakat occurs 32 times, while blessing (barakah) occurs 32 times, indicating that Zakat is a cause of blessing.

The word Human being (Insan) is mentioned in 65 places. In addition, the stages of the creation of the human being are described in 65 verses.

Plant (nabat) occurs 26 times, while tree (shajarah) occurs 26 times.

Wine (khamr) occurs 6 times, while intoxication (sukr) occurs 6 times.

Summer occurs 5 times, heat 5 times, winter 5 times, and cold 5 times.

Rich occurs 26 times, while poor occurs 13 times, exactly half as many.

The expression “He created you” occurs 16 times, while the expression “worship [Allah]” occurs 16 times, indicating that creation necessitates worship.

Rahim occurs 114 times, while Rahman occurs half as many times, namely 57 times.

The Name Rahman carries the meaning of Allah’s mercy toward all created beings, while the Name Rahim carries the meaning of Allah’s mercy toward those who believe in Him.

Deed (fi‘l) occurs 108 times, while reward (ajr) occurs 108 times.

Benefit occurs 50 times, while harm occurs 50 times.

Affliction (musibah) occurs 75 times, while gratitude (shukr) occurs 75 times.

Spending in the way of Allah (infaq) occurs 73 times, while contentment (rida) occurs 73 times.

Magic (sihr) occurs 60 times, while trial/temptation (fitnah) occurs 60 times.

Intellect (aql) occurs 49 times, while light (nur) occurs 49 times.

It is worth reminding ourselves once again. The Messenger of Allah (peace and blessings of Allah be upon him) was a person who could neither read nor write and received Prophethood between the years 610 and 632. In the Age of Ignorance in Arabia, a person who could neither read nor write was conveying, over a period of 23 years, the verses that were revealed concerning the events and circumstances he encountered. These verses were not revealed in chronological sequence either; rather, they were revealed in a mixed order.

It would not be possible for a human being to arrange these words and numbers in such a manner over the 23 years during which the Qur’an was revealed.

“Say: If mankind and jinn were to come together to produce the like of this Qur’an, they could not produce its like, even if they were to support one another.”

(Surah al-Isra’, 17:88)

“Say: Believe in it or do not believe. Indeed, when it is recited to those who were given knowledge before it, they fall upon their faces in prostration.”

(Surah al-Isra’, 17:107)

“And they say: Glory be to our Lord. Surely the promise of our Lord is bound to be fulfilled.”

(Surah al-Isra’, 17:108)

Whether you believe in these miracles or not is up to you, dear reader.

Allah declares that He will cast those who deny and those who close their eyes and ears to the truth into Hell in the Hereafter, blind and deaf, upon their faces. Everyone is free in the choice they make. If you wish, you may continue for a little longer without believing. But remember: death is real and may come at any moment.

Then you may find yourself with empty hands and tearful eyes, without any helper to turn to.

THE DOG KITMIR MENTIONED IN THE QUR'AN

One of the pieces of evidence that can be presented as proof that the Qur'an could not have been altered is the fact that, alongside the people whom we know as the "Seven Sleepers," there is an eighth companion: the dog Kitmir. The name Kitmir does not directly appear in the Qur'an. We know the name Kitmir from the *sīrah* and from the histories of the Prophets.

On page 294 of the Qur'an, it appears only in the form of "wa kalbuhum" ("and their dog"). At the same time, 141 pages later, the word "qitmir" appears in the Qur'an, but its meaning has nothing to do with a dog. Qitmir refers to the thin membrane on the pit of a date, and its lexical meaning is something very small and insignificant, something of little value. Indeed, this is the meaning in which it is used in the Qur'an as well.

In this case, when we examine the word kalbuhum on page 294 in terms of its position on the page, it is located exactly above the word "qitmir," which appears 141 pages later. In other words, when the book is closed, these two words lie exactly on top of one another.

It is worth emphasizing this again and again. Between 610 and 632, our Master (PBUH), who was illiterate, was conveying verses that were being revealed in response to the events that occurred. In the Age of Jāhiliyyah in Arabia, a person who could neither read nor write was, over a period of 23 years, conveying these verses, even though they were not being revealed in sequence but rather in a mixed order.

Such an arrangement could not possibly have occurred by chance, dear reader.

الجزء : ٢٢ (٣٥) سورة قاطر (٤٦) الصريحة : ٤٣٥	وَمَا يَسْتَوِي الْبَحْرَانِ هَذَا عَذْبٌ فُرَاتٌ سَائِعٌ هَدْرَابُهُ وَهَذَا مِلْحٌ أُجَاجٌ وَمِنْ كُلِّ تَاكُلُونَ لَعْنًا طَرِيًّا وَتَسْمَعُونَ حُرُورَ جَالِيَةٍ تَلْبِسُونَهَا وَتَكْرِى الْغُلَاكَ فِيهِ مَوْبِجٌ لِيَتَّبِعُوا مِنْ قَضِيلِهِ وَلَعَلَّكُمْ تَشْكُرُونَ وَيَوْمَ الْبَلِّ فِي الظَّهَارِ يُوَلِّجُ الْظَّهَارُ فِي الْبَلِّ وَسَحَرُ الشَّمْسِ وَالْقَمَرِ كُلُّ نَجْوَى بِأَجَلٍ مُسَمًّى لَكُمْ اللَّهُ رُبُّكُمْ لَهُ الْمُلْكُ وَالَّذِينَ تَدْعُونَ مِنْ دُونِهِ مَا يَخْلُقُونَ مِنْ فُطَيْرٍ إِنَّ تَدْعُوهُمْ لَا يَسْمَعُوا دُعَاءَكُمْ وَلَوْ سَمِعُوا مَا اسْتَجَابُوا لَكُمْ وَيَوْمَ الْقِيَامَةِ يَكْفُرُونَ بِيُرُوكُمْ وَلَا يُنَبِّئُكَ مِثْلُ خَبِيرٍ يَا أَيُّهَا النَّاسُ أَنْتُمُ الْفُقَرَاءُ إِلَى اللَّهِ وَاللَّهُ هُوَ الْغَنِيُّ الْحَمِيدُ إِنْ يَشَاءُ يُدْهِبْكُمْ وَيَأْتِ بِخَلْقٍ جَدِيدٍ وَمَا ذَلِكَ عَلَى اللَّهِ بِكَرٍهٍ وَلَا تَرَوْا وَرْدَهُ وُورًا أُخْرَى وَأَنْ تَذُدُّ مِثْقَالَ حَبَّةٍ لَنْ يَحْمَلَ مِنْهُ شَيْءٌ وَلَوْ كَانَ ذَا قُرْبَى إِنَّا تُنذِرُ الَّذِينَ يُخْشَوْنَ رَبَّهُمْ بِالْغَيْبِ وَأَفْأَمُوا الصَّلَاةَ وَمَنْ تَرَكُ فَإِنَّمَا يَشْرِكُ بِإِنْفُسِهِ وَاللَّهُ الْمُصِيبُ	وَمَا

A VISIBLE MIRACLE WITHIN THE HOLY QUR'AN

The verses of the Holy Qur'an were revealed over a period of 23 years, at different times and in different orders, as revelation immediately following certain events that were taking place at that time.

After the verses were revealed to our Noble Prophet (PBUH), they were written down by the scribes of revelation on bones, pieces of leather, leaves, wooden boards, and similar materials. Since revelation was still continuing and memorization, that is, committing the Qur'an to memory, was the primary means

of preservation, it was not possible to compile the Qur'an into a single book during the lifetime of our Noble Prophet (PBUH).

During the time of Abu Bakr (RA), following the martyrdom of a number of those who had memorized the Qur'an, the decision was made to compile the Qur'an. Zayd ibn Thabit collected all the written sheets, taking them with witnesses, and compiled them into a book.

The text of all Qur'ans written down throughout history up to the present day has never been altered. However, different page layouts were used in their writing, such as 11 lines per page, 12 lines per page, or 13 lines per page.

Approximately twelve centuries after the first Qur'an, Kayışzâde Hâfız Osman based his writing of the Holy Qur'an on two principles.

For the length of the page, the longest verse, the "Verse of Debt" (al-Mudāyanah, Surah al-Baqarah 2:282), would serve as the measure. The Verse of Debt would be proportioned so that it would begin at the top of the page and end at the bottom of the page.

For the length of the lines and the width of the page, the shortest surahs, Surah al-Ikhlās and Surah al-Kawthar, would serve as the measure.

When the Holy Qur'an is written according to these measurements, it can be seen that all of its pages, that is, all 604 pages, begin with a verse and end with a verse.

Approximately 50 years after this arrangement was discovered, a great and respected scholar of his time, a scholar named Bediuzzaman, noticed that, when one paid attention, the words "Allah" could be aligned vertically, one beneath another.

In the Qur'an written in the calligraphic style of Hamid Ayaç, the word "Allah" appears 2,806 times, the word "Rabb" 846 times, the word "Rahmān" 159 times, and the word "Rahīm" 220 times. Along with His other Names, more than 4,000 occurrences can be seen to align vertically, one beneath another. When the book is closed, it can be seen that these words align with one another, both one above the other and back-to-back, forming an extraordinary symmetrical order.

Even someone whose intellect has descended into his eyes could not deny this miracle, which is plainly visible to the naked eye. One does not need to be a Muslim to understand this miracle, nor does one need to know how to read the Qur'an.

Let us remind ourselves once again, dear reader. Our Noble Prophet (PBUH), who was a prophet between the years 610 and 632, was unable to read or write. In the age of ignorance in Arabia, a person who could neither read nor write conveyed, over a period of 23 years, the verses that were revealed in response to the events that took place. Moreover, these verses were not revealed in sequence; they were revealed in a mixed and non-sequential order. The fact that such an arrangement was discovered many, many years after the Qur'an had been revealed and even after it had been compiled into a book demonstrates that it could not have been written by the human mind.

Therefore, the Qur'an cannot be the word of a human being.

THE HIEROGLYPH MIRACLE

First of all, let us explain what the Hieroglyph Miracle is.

“Neither the heaven nor the earth wept for them, nor were they given any respite.” (Surah Ad-Dukhan, 29)

After the events that befell Pharaoh and his army are described in the Qur’an, Verse 29 of Surah Ad-Dukhan states that neither the heaven nor the earth wept for them.

In Egyptian hieroglyphs, after an inscription was discovered stating, “...the heavens and the earth weep for him, the spirit of Pharaoh ascends to heaven and takes its place among the gods...,” believing and denying groups became divided over the existence of this miracle.

When searches are made for the term “Hieroglyph Miracle,” we encounter two different groups, one defending the existence of this miracle and the other denying it, along with a great deal of unfounded media content.

Our purpose here is not to force anyone to believe anything. As always, let us present what actually exists, and together decide whether to believe it or not, or what it would be reasonable to believe.

In order to understand this matter, there are three points that we need to know and clarify: the Rosetta Stone, the Pyramid Texts of Unas, and the Pharaoh lamentation ritual.

The Rosetta Stone appears as one of the most important archaeological discoveries that made it possible to decipher ancient Egyptian writing. In 1799, during Napoleon Bonaparte’s Egyptian Campaign, French soldiers discovered a black granodiorite stone near the city of Rashid (Rosetta) in Egypt, bearing a text dated to 196 BC. The stone’s most notable feature is that the same text was written on it simultaneously in three different scripts: Hieroglyphic (the temple script), Demotic (the script used by the people at that time), and Ancient Greek.

The writings discovered in 1799 were almost completely deciphered in 1822 by Jean-François Champollion, since Ancient Greek was already known. Therefore, from 1822 onward, we became able to read hieroglyphs.

The Hieroglyphs of the Pyramid of Unas are famous for the hieroglyphic inscriptions carved into the walls of its inner chambers and are regarded as among the oldest known religious writings in history. In the literature, they are referred to as the Pyramid Texts. Their purpose is to ensure that the soul of the deceased Pharaoh safely reaches the afterlife, the stars, and the gods.

The Lamentation Rituals for Pharaoh; In Ancient Egypt, death was regarded not as the end, but as the beginning of a transition, and lamentation was an important ritual element in the funerary ceremonies of pharaohs (and the elite class in general). When a pharaoh died, he was identified with Osiris.

During funeral processions, professional female mourners, sometimes referred to as “Kites” or “Dryt,” would take part. These women would let their hair loose, beat their breasts, apply mud or ashes to themselves, and cry out loudly in mourning. Usually, two women representing the goddesses Isis and Nephthys, the sisters in the Osiris myth, would stand at the head and foot of the deceased, because according to the mythology, these two goddesses had lamented for the slain Osiris. This ritual was performed following the death of every pharaoh.

A portion of the text of this ritual reads as follows:

“... When this text ascends to the heavens, it concerns the deceased pharaoh, who must first contend for sovereignty among the ancient gods. When the sky sees the king ascending as a spirit, as a god who lives from his fathers and possesses his mothers, the sky weeps, the stars tremble, the guardians of the gods shake, and their servants flee. His servants have captured the gods with a rope, deemed them acceptable, dragged them here, bound them, and to them...”(Dieterich, Albrecht, 1866–1908; Wunsch, Richard, 1869–1909, *Eine Mithrasliturgie*)

κατακαλῶσι. καὶ τὰ σώματα τοίνυν μετὰ ἀπὸ
τούτων· καὶ γὰρ μάλιστα ταῖς ποιαῖς τροφαῖς χαίρουσι.
σιτουμένων γὰρ ἡμῶν προσίαισι καὶ προσιζάνουσι
τῷ σώματι καὶ διὰ τοῦτο αἱ ἀγνεῖαι, οὐ διὰ τοὺς
θεοὺς προσηγούμενως, ἀλλ' ἵν' οὗτοι ἀποστῶσι.
μάλιστα δ' αἵματι χαίρουσι καὶ ταῖς ἀκαθαρσίαις καὶ
ἀπολαύουσι τούτων εἰσδύνοντες τοῖς χρωμένοις.
Unsere Körper sind voll böser Dämonen und hauptsäch-
lich, wenn wir essen, kommen sie herein. Seine unbedingt
richtige Angabe von der ursprünglichen Bedeutung der
ἀγνεῖαι könnte für uns etwa noch besonderen Wert
haben, da ja auch der Myste unserer Liturgie nur ἄγιοις
ἀγιασθεῖς ἀγιάσματος (4, 22 f.), die nicht weiter angegeben
werden, das Göttliche schauen und in sich aufnehmen
kann. Aber freilich war ja Reinigung vor jeglicher Art
von Weihe längst feste Form des Kultus geworden.

Daß der Mensch sich mit einem Gotte vereinigen
kann, dadurch, daß er ihn oder Stücke von ihm ißt,
bewährt sich immer wieder als uralter, aus der Tiefe
ursprünglichster religiöser Anschauung empordrängender
Glaube. Wie der Wilde glaubt, die Kräfte des wilden
Tieres zu erlangen, die Klugheit und Zaubermacht des
weißen Mannes sich zu eigen zu machen, wenn er von
ihm ißt, so gewinnt er göttliche Kraft und Macht, wenn
er Göttliches ißt.

Stellen anderer Beispiele mag ein ägyptischer Text

man Beispiele in Fülle, dazu Brinton *Religions of primitive
peoples* 189 ff.

When we come to the discussions concerning the alleged miraculous aspect, as can be seen, the pharaoh lamentations state that “the sky weeps” for the pharaoh. In the Qur’an, however, it is stated:

“And neither the heaven nor the earth wept for them.”

The disbelieving side, particularly social media personalities known for their agnostic and atheistic views, say: “Nothing like this is written on the Rosetta Stone. Muslim miracle enthusiasts have fabricated this. Moreover, even if it really were written there, we cannot know that the pharaoh mentioned in the hieroglyphic text is the same pharaoh mentioned in the Qur’an.”

Muslim personalities, on the other hand, say: “This is a miracle of the Qur’an; the atheists are lying.”

So, what is the truth of the matter?

The truth of the matter is this, dear reader.

The text we shared above, which appears in Pharaoh mourning rituals, is real. The words in this text are part of a ritual, and not a ritual performed for only one particular Pharaoh, but a ritual carried out after the death of every Pharaoh. Those who are capable of conducting in-depth research and reading deeply can verify what I am saying, together with its sources.

The words that are the subject of the miracle are not written on the Rosetta Stone. They are written in the Pyramid Texts of Unas. The Rosetta Stone merely paved the way for humanity to be

able to read hieroglyphs. It is a bureaucratic, religious, and political decree written in 196 BC in the name of Ptolemy V.

Therefore, we are left with two established facts regarding the hieroglyphic miracle. One is verse 29 of Surah Ad-Dukhān, and the other is humanity's definitive finding.

Humanity's definitive finding is that rituals were performed after the death of Pharaohs with the expression, "The heavens and the earth wept after the Pharaoh."

The verse of the Qur'an, on the other hand, is perfectly clear: "The heavens and the earth did not weep for them after their departure."

During the time of the Prophet Muhammad (peace and blessings of Allah be upon him), knowledge of hieroglyphs had already been lost. The period in which Prophet Muhammad (peace and blessings of Allah be upon him) lived was 570–632 AD. The ability to read Egyptian hieroglyphs had been forgotten by the 4th–5th centuries AD. By then, even the Egyptians themselves could no longer read hieroglyphs. Coptic and Greek were used in daily life in Egypt, and the Rosetta Stone had not yet been discovered. The stone was accidentally discovered in 1799.

Therefore, the hieroglyphic miracle is truly a miracle.

Life is like a drop of water falling onto the soil, emerging from where it falls as a plant, then dying as a dry piece of branch and becoming soil again. To witness so many miracles and yet behave as though you will never wither away, how wise is that, dear reader?

THE MIRACLE OF INTERNAL WAVES

One of the very significant proofs that the Qur'an was sent by Allah is the “miracle of internal waves.”

Norwegian oceanographer Fridtjof Nansen, during the exploration voyage of the Arctic Ocean between 1893 and 1896, noticed that his ship, the Fram, sometimes slowed down even when there was no visibly significant wind or surface wave, as though it were being pulled by an invisible force. Among sailors, this phenomenon was known as “dead water.”

In 1904, Fridtjof Nansen and physicist Vagn Walfrid Ekman proved, through laboratory experiments and analyses, that

this phenomenon was caused by internal waves forming at the boundary, beneath the surface of the water, between two layers of water with different densities, such as fresh water and salt water.

The fact that internal waves are a widespread phenomenon throughout the oceans and can reach hundreds of meters in magnitude was fully mapped with the development of underwater acoustic instruments (sonar) and the widespread use of satellite imagery during the second half of the 20th century.

At the beginning of the 7th century, that is, at the time when the Qur'an was revealed, neither in the Arabian Peninsula nor anywhere else in the world did human beings possess the technological or academic means to detect, measure, or physically explain internal waves in the scientific sense of oceanography.

“Or [the deeds of the disbelievers] are like layers of darkness in a vast, deep sea, covered by waves upon waves, topped by clouds; layers of darkness, one above another. If one stretches out his hand, he can hardly see it. And whoever Allah has not given light, for him there is no light.” (Surah An-Nur, 40)

Allah informed us of this 1,300 years before the discovery of internal waves, ocean layers, and the darkness in the depths of the ocean. At that time, it was impossible to descend into the dark regions of the ocean, that is, below a depth of 200 meters. It was impossible to know about internal currents or internal waves. There were no submarines and no equipment. Without equipment, a human being can descend to a maximum depth of about 20 meters, and even at such depths, remaining there without losing consciousness is almost impossible.

Because of this undeniable reality, it is scientifically, as well as rationally and logically, impossible for the explanation in the Qur'an of “wave upon wave, topped by clouds,” and the verse describing “layers of darkness, one above another” where “a person cannot even see his own hand,” to have been written by a human being while referring to the deep layers of the ocean and internal waves.

Even if people who do not want to believe were to describe some miracles as having occurred “by chance,” they would not have a single word to say against such a miracle.

One piece of evidence is sufficient to establish the existence of something with certainty, dear reader. This miracle is also

definitive evidence. Allah exists. Allah sent down the Qur'an so that human beings may find the right path.

I know that it is very difficult to accept the truths as they really are because they have always been presented to you as if they were merely dreams or stories. I can imagine that accepting that everything you have believed until now is actually very different, and the thought of suddenly becoming responsible, may feel heavy to you. However, whether you believe or deny, you will die, and when the Day of Judgment comes, if you died in denial, you will deeply regret it. The fact that you do not believe right now will never change the truth.

Your Lord is Most Merciful. The door of repentance remains open until death. Do not be afraid or anxious. Do not let the thought of giving up the temporary pleasures of this world trouble you.

You only need to turn sincerely toward Him; your Lord will help you, insha'Allah.

THE CHROMOSOME MIRACLE

All living beings in the world, including human beings, have a specific genetic structure. All living organisms have a specific number of chromosomes in their healthy cells. Even the slightest change in the number of chromosomes can lead to serious abnormalities for each organism. For example, healthy human cells contain 23 pairs, or 46 chromosomes; if this number increases to 47 or 48, the child will be born with a fatal birth defect.

The Holy Qur'an is not a book that teaches genetics. However, it contains such a miracle that it gives indications concerning chromosome numbers that no one living at the time it was revealed could possibly have known.

Male bees have 16 chromosomes. The Qur'an's An-Nahl (The Bee) Surah is the 16th surah of the Qur'an.

Human beings have 46 chromosomes. In mathematics, 46 is the 31st non-prime (composite) number.

In the same way, we see that in some instances, words such as cow, dog, camel, and pig mentioned in the Qur'an occur immediately before or after the position corresponding exactly to the chromosome number of the respective animal.

We see the chromosome miracle in several ways.

Animal names occur at positions corresponding to their chromosome numbers.

There are the same number of Arabic letters as the chromosome number immediately before or after the animal's name.

We can also consider the positions of the animal names as prime numbers. For example, human beings have 23 pairs of chromosomes. The number 23 is the 9th prime number in the universe. We see that the position of the word "human" in the verse is at number 9.

We can also consider the positions of animal names as composite numbers. For example, monkeys have 48 chromosomes. The number 48 is the 32nd composite number. We see that there are 32 Arabic letters immediately before or after the word "monkey."

Prime numbers are whole numbers greater than 1 that are exactly divisible only by 1 and themselves. Composite numbers, on the other hand, are positive integers that can be formed as the product of two smaller positive integers.

We see this system perfectly, especially in Qur'ans written according to the Uthmani script. This is because the Uthmani Qur'anic writing system is the oldest and purest method of writing.

This will involve a little detail, but we have to mention it in order to avoid confusion. In Qur'ans written according to other writing systems, the letters may differ. For example, in the Uthmani Qur'an, when writing the word "Al-Insan," a fatha is used above the letter "sin," and in this case the number of letters in the word "insan" is 6. In other writing systems, an alif is placed after the

letter “sin,” in which case the number of letters becomes 7. Therefore, if you wish to count and verify these details yourself, it would be more appropriate to examine a Qur’an written according to the Uthmani script.

List of Animals Mentioned in the Quran and Their Chromosome Numbers			
ANIMAL NAME	HAPLOID CHROMOSOME COUNT	DIPLOID CHROMOSOME COUNT	COMPOSITE / PRIME NUMBER STATUS
Human	23	46	23, 9th prime number 46, 31st composite number
Monkey	24	48	48, 32nd composite number
Bee	Male Bee 16, Queen and Worker Bee 32	16, 32	—
Horse	32	64	64, 45th composite number
Donkey	31	62	62, 43rd composite number
Pig	19	38	38, 25th composite number
Camel	19	74	74, 52nd composite number
Cow	37	74	60, 42nd composite number
Sheep	27	54	54, 37th composite number
Dog	39	78	78, 56th composite number
Hoopoe Bird	63	126	63, 44th composite number
Spider, Ant, Snake	—	There are many species. Different species have different chromosome counts.	—

HUMAN

An adult human cell contains 23 pairs, or 46 chromosomes. Sperm and egg cells contain 23 haploid chromosomes.

We know that the first revelation of the Qur’an was the first few verses of Surah Al-‘Alaq, which is the 96th Surah. The word “human” (Al-insan) appears in the 2nd, 5th, and 6th verses of this Surah.

“Read in the name of your Lord Who created! He created man from a clinging clot (the fertilized ovum). Read! And your Lord is the Most Generous, Who taught by the pen, taught man that which he did not know. No indeed! Man truly transgresses because he sees himself as self-sufficient.”

Even if you do not know Arabic, it is possible to see the miracle simply by counting the letters.

If we take the title of Surah Al-‘Alaq as the starting point and begin counting from the beginning of the first verse, there are 23 letters up to the first occurrence of the word “human” (insan).

If we begin counting from the beginning of the second verse, which contains the word “human,” there are 46 letters up to the next occurrence of the word “human.”

Likewise, if we begin from the beginning of the fifth verse, which also contains the word “human,” there are again 23 letters up to the next occurrence of the word “human.”

The Qur’an has explicitly stated it, as it were. It points to the formation of a human being with 46 chromosomes through the coming together of 23 pairs of haploid chromosomes.

Likewise, the word “human” appears in the third verse of Surah Az-Zalzalah, the 99th Surah of the Qur’an. When the letters are counted from the beginning of the first verse, we again see that there are 46 letters, indicating the 46 chromosomes that constitute the human being.

“When the earth is shaken with its own particular shaking, and brings forth its contents, and man says, ‘What is happening to it?’” (Surah Az-Zalzalah 1–3)

Likewise, the word “human” (insan) also appears in the third verse and the fourteenth verse of Surah Ar-Rahman. When we count the letters from the beginning of the Surah up to the first occurrence of the word “human,” we arrive at the number 23.

When we count from the beginning of the thirteenth verse of Surah Ar-Rahman up to the next occurrence of the word “human,” we likewise find 23 letters.

“Ar-Rahman taught the Qur’an. He created man.” (Surah Ar-Rahman 1–3)

“Then which of the favors of your Lord will you both deny? Allah created man from clay like pottery.” (Surah Ar-Rahman 13–14)

The word “human” (insan) appears in verse 4 of Surah At-Tin, the 95th Surah of the Qur’an. When we count from the beginning of the verse, we find 46 letters up to the word “human.” When we count from the beginning of verse 3, we likewise find 23 letters.

“By the fig and the olive, and by Mount Sinai, and by this secure city (Makkah), We have certainly created man in the finest form.” (Surah At-Tin 1–4)

We see the same miracle in Surah An-Nisa as well. The word “human” (insan) appears in verse 28 of Surah An-Nisa, and when we count from the beginning of the verse, we find 23 letters.

We see the same miracle systematically in many places throughout the Qur’an, not merely in one or two verses.

“Allah wishes to lighten the burdensome obligations of the religion for you, for man was created weak in terms of patience and endurance.” (Surah An-Nisa, 28)

“The example of the hypocrites is like that of Satan. For Satan says to man, ‘Disbelieve’; but when man disbelieves, he says, ‘Indeed, I am free of you. Surely, I fear Allah, the Lord of the worlds.’” (Surah Al-Hashr, 16)

“He created man from a drop of fluid (nutfah), yet behold, he has become an open adversary to his Lord.” (Surah An-Nahl, 4)

“He has given you all that you have asked of Him. If you were to count the blessings of Allah, you could never enumerate them. Indeed, man is truly unjust and extremely ungrateful.” (Surah Ibrahim, 34)

“Man says, ‘When I die, will I really be brought forth alive (from the earth)?’” (Surah Maryam, 66)

“Yet they have attributed to Allah some of His servants as a part of Him. Indeed, man is clearly ungrateful.” (Surah Az-Zukhruf, 15)

“Indeed, We created man, and We know what his soul whispers to him. For We are closer to him than his jugular vein.”
(Surah Qaf, 16)

“Allah created you first from dust, then from a small amount of fluid (semen). Then He made you into pairs, male and female. No female conceives or gives birth without His knowledge. No one is granted a long life, nor is anyone’s lifespan shortened, except that it is recorded in a Book (the Preserved Tablet). Surely, this is easy for Allah.” (Surah Fatir, 11)

“His companion replied to him, ‘Do you disbelieve in Allah, who created you from dust, then from a drop of fluid (sperm), and then fashioned you into a complete human being?’” (Surah Al-Kahf, 37)

“Does man not see that We created him from a small amount of fluid (semen), yet behold, he has become an open adversary?” (Surah Ya-Sin, 77)

“He is the One who created you from dust, then from a small amount of fluid (semen), then from an ‘alaqah’, then brought you forth as infants from your mothers’ wombs, then allowed you to reach maturity, and then old age. And among you are those who die before that. He does all this so that you may reach an appointed term and so that you may understand and reflect.” (Surah Ghafir, 67)

These many examples already establish the miracle, but some readers may still wonder, “Could this have simply been a coincidence?” Let us continue explaining it in such detail that there is no room left for doubt, and let us present the evidence one by one.

Let us examine it from another perspective. Let us see whether these occurrences are merely coincidental, or whether these words were deliberately arranged in this way by Allah.

Let us examine the number of human chromosomes according to the sequence of prime numbers and composite numbers. In mathematics, numbers that are divisible only by themselves and by one are called prime numbers, while numbers that can also be divided by other numbers are called composite numbers. For example, the first prime number is “2.” The second prime number is “3.” When we count them in this way, the number “23” is the ninth prime number. Likewise, the first composite number is “4.” The second composite number is “6.” The third composite number is “8.” When we count them in this way, the number “46” is the thirty-first composite number.

Let us therefore examine the words “human” (insan) and “nutfah” (sperm, semen) mentioned in the Qur’an through the numbers “9” and “31.”

Surah Al-Insan is the 76th Surah of the Qur’an and is also known as Surah Ad-Dahr. It was revealed during the Medinan period and consists of “31” verses.

The word “human” (insan) appears in the first and second verses of this Surah. In the first verse, the word “human” occurs in the 9th position.

“Has there not come upon man a period of time when he was not yet a thing worthy of mention?” (Surah Al-Insan, 1)

“Indeed, We created man from a drop of mixed fluid (semen), and We shall test him. Therefore, We made him hearing and seeing.” (Surah Al-Insan, 2)

As mentioned earlier, the word “human” (insan) appears in verses 1 and 2. If we count the letters used in these two verses, excluding repetitions, we see that there are also 23 distinct letters.

“Man supplicates for evil just as he supplicates for good. Man is ever hasty.” (Surah Al-Isra, 11)

“Was he not a drop of fluid that was emitted?” (Surah Al-Qiyamah, 37)

“If We let man taste a mercy from Us, and then take it away from him, he surely becomes despairing and ungrateful.” (Surah Hud, 9)

9

قُتِلَ الْإِنْسَانُ مَا أَكْفَرَهُ

10

Human

مِنْ أَيِّ شَيْءٍ خَلَقَهُ

20

31

مِنْ نُّطْفَةٍ خَلَقَهُ فَقَدَّرَهُ

Sperm

“May man be destroyed! How ungrateful he is! From what did Allah create him? From a small amount of fluid (sperm). He created him and proportioned him.” (Surah ‘Abasa, 17–19)

ثُمَّ جَعَلْنَاهُ نُطْفَةً فِي قَرَارٍ مَّكِينٍ
Sperm

“Then We placed him as a drop of fluid (semen) in a secure resting place (the mother’s womb).” (Surah Al-Mu’minun, 13)

فَبَيِّتِ الْآءِ رَبِّكُمَا تُكَذِّبَانِ

“Then which of the favors of your Lord will you both deny?” (Surah Ar-Rahman, 55)

In Surah Ar-Rahman, this sentence, which addresses both mankind and the jinn, is repeated exactly 31 times.

Dear reader, we can see that the Qur’an cannot be the word of a human being. These verses, which were revealed in a dispersed manner and often in response to events taking place at that very moment, could not have been arranged in this way by human hands. Such a system could not have occurred by mere coincidence either.

MONKEY

The body cells of monkeys contain 24 pairs, or 48 chromosomes. The number 48 is the 32nd composite (non-prime) number.

“Surely, you know those among you who transgressed the Sabbath. We said to them, ‘Become despised apes.’” (Surah Al-Baqarah, 65)

“But when they stubbornly persisted in doing what they had been forbidden from doing, We said to them, ‘Become despised apes.’” (Surah Al-A‘raf, 166)

“Say, ‘Shall I inform you of those whose recompense is worse than this in the sight of Allah? They are those whom Allah has cursed and upon whom His wrath has fallen, those from among whom He made apes and swine, and those who worshipped the Taghut. These are in a worse position and are further astray from the straight path.’” (Surah Al-Ma’idah, 60)

BEE

There are three different types of bees in a hive: the queen bee, the female (worker) bee, and the male bee. Queens and worker bees have 16 pairs, or 32 chromosomes. Since male bees develop from unfertilized eggs, they carry only the 16 chromosomes contained in the egg.

The 16th Surah of the Qur’an is Surah An-Nahl, which means “The Honey Bee.” This Surah consists of 128 verses. The number 128 can be divided evenly by both 16 and 32. The first

occurrence of the word “bee” appears in verse 68, and the last letter of the word is in the 16th position.

“Your Lord inspired the honey bee: ‘Take homes for yourself in the mountains, in the trees, and in the structures that people build.’” (Surah An-Nahl, 68)

This verse consists of 16 distinct letters.

“Indeed, Allah is with those who are mindful of Him and those who do good.” (Surah An-Nahl, 128)

The 128th and final verse of Surah An-Nahl is divisible without remainder by both 16 and 32. At the same time, there are a total of 32 letters in the verse.

HORSE

A horse's genome contains 32 haploid and 64 diploid chromosomes, and the number 64 is the 45th composite (non-prime) number.

“Beautified for man is the love of that which he desires: women, children, heaps of gold and silver, branded horses, cattle, and cultivated land. These are the enjoyments of the worldly life, but with Allah is the best return.” (Surah Al ‘Imran, 14)

“And He created horses, mules, and donkeys for you to ride and as adornment. And He will create things that you do not know.” (Surah An-Nahl, 8)

“And prepare against them whatever force you can, and horses kept ready for combat, so that you may strike fear into the enemies of Allah and your enemies, and others besides them whom you do not know but whom Allah knows. Whatever you spend in the cause of Allah will be repaid to you in full, and you will not be wronged.” (Surah Al-Anfal, 60)

DOMUZ

Pigs have 19 pairs, that is, 38 diploid chromosomes. The number 38 is the 25th composite (non-prime) number.

“Forbidden to you are carrion, blood, the flesh of swine, that which has been slaughtered in the name of anyone other than Allah, animals that have been strangled, killed by a blow, killed by a fall from a height, killed by goring, or killed by a wild animal, unless you slaughter them properly before their death, and those slaughtered on stone altars, as well as dividing your lot through arrows. All of this is disobedience to Allah. Today, the disbelievers have despaired of defeating your religion. So do not fear them; fear Me. Today I have perfected your religion for you, completed My favor upon you, and chosen Islam as your religion. But whoever is compelled by severe hunger, without inclining toward sin, then indeed Allah is Most Forgiving, Most Merciful.” (Surah Al-Ma'idah, 3)

EŞEK

A donkey has 31 haploid and 62 diploid chromosomes. The number 62 is the 43rd composite (non-prime) number.

“Or have you not considered the example of the one who passed by a town that had fallen into ruin and was lying desolate? He said, ‘How will Allah bring this back to life after its death?’ So Allah caused him to die and kept him dead for a hundred years, then brought him back to life and asked him, ‘How long have you remained?’ He replied, ‘I remained for a day or part of a day.’ Allah said, ‘Rather, you have remained for a hundred years. Look at your food and drink; they have not spoiled. And look at your donkey! We have done this so that We may make you a sign of Our power for the people. And look at the bones, how We bring them together and then clothe them with flesh.’ When all this became clear to him, he said, ‘Now I know that Allah is indeed Powerful over all things.’” (Surah Al-Baqarah, 259)

“The example of those who were entrusted with the Torah and yet did not act according to it is like that of a donkey carrying volumes of books. How terrible is the example of those who deny the signs of Allah! Allah does not guide the wrongdoing people.” (Surah Al-Jumu‘ah, 5)

In verse 8 of Surah An-Nahl, the names of the horse, mule, and donkey appear in a specific order. We see that the word “mule” is positioned between “horse” and “donkey.” A mule is a hybrid offspring of a female donkey and a male horse. If we count the letters backward from the end of the verse, there are 32 letters, including the word “donkey.” $32 \times 2 = 64$, which is the number of chromosomes in a horse. The word “horse” is exactly in the 43rd position, and 62, the number of chromosomes in a donkey, is the 43rd composite (non-prime) number.

Allah has placed the mule in the middle, clearly pointing to its hybrid origin.

“ And He created horses, mules, and donkeys for you to ride and as adornment. And He will create things that you do not know.” (Surah An-Nahl, 8)

DOG

Dogs have 39 pairs, or 78 diploid chromosomes, in their genomes. The number 78 is the 56th composite number.

“If We had willed, We could certainly have raised him up through those verses. But he clung to the world and followed his own desires and inclinations. His example is like that of a dog: if you drive it away, it pants with its tongue hanging out, and if you leave it alone, it still pants with its tongue hanging out. Such is the example of the people who deny Our signs. So relate these accounts to them so that they may reflect.” (Surah Al-A‘raf, 176)

In verse 18 of Surah Al-Kahf, if we count the letters backward from the end of the verse, there are 56 letters before the word “their dog.” The number 78, which is the number of chromosomes in a dog, is the 56th composite number.

“Although they were asleep, you would have thought they were awake. We turned them from side to side, while their dog lay at the entrance of the cave, stretching out its forelegs. Had you seen them, you would certainly have turned away from them and fled, and you would have been filled with fear at the sight of them.” (Surah Al-Kahf, 18)

The word “dog” appears three times in verse 22 of Surah Al-Kahf. There are 39 letters immediately before the second occurrence of the word “dog” in this verse. Dogs have 39 haploid chromosomes.

“Some will say, ‘They were three, and their fourth was their dog.’ Others will say, ‘They were five, and their sixth was their dog,’ guessing at what is unknown. And some will say, ‘They were seven, and their eighth was their dog.’ Say, ‘My Lord knows best their number.’ Only a few have knowledge of it. So do not engage in argument concerning them except with what has been made known, and do not ask anyone about them.” (Surah Al-Kahf, 22)

CAMEL

A camel has 37 pairs, or 74 diploid chromosomes. The number 74 is the 52nd composite number.

“Finally, they hamstrung the she-camel, disobeyed the command of their Lord, and said, ‘O Salih! If you are indeed one of the messengers, then bring upon us the punishment with which you have threatened us.’” (Surah Al-A‘raf, 77)

“Nothing has prevented Us from sending the miracles they requested, except that the earlier peoples denied them. Indeed, We gave the people of Thamud the she-camel as a clear miracle, but they became wrongdoers because of it. Yet We send the miracles only to warn and admonish.” (Surah Al-Isra, 59)

COW

A cow has 30 haploid and 60 diploid chromosomes. The number 60 is the 42nd composite number.

““They said, ‘Call upon your Lord for us to make clear to us what kind of cow it is.’ Moses said, ‘My Lord says: It is a cow neither too old nor too young, but of an age in between. So do what you have been commanded.’” (Surah Al-Baqarah, 68)

““They said, ‘Call upon your Lord for us to make clear to us what color it is.’ Moses said, ‘My Lord says: It is a bright yellow cow, pleasing to those who look at it.’” (Surah Al-Baqarah, 69)

“They said, ‘Call upon your Lord for us to make clear to us what kind of cow it is, for all cows seem alike to us. And if Allah wills, we will surely find it.’” (Surah Al-Baqarah, 70)

SHEEP

The sheep genome has 27 pairs, or 54 diploid chromosomes. The number 54 is the 37th composite number.

“We forbade the Jews all animals with claws. As for cattle and sheep, We also forbade them their fat, except what is carried on their backs, or is contained in their intestines, or is mixed with their bones. Thus We punished them for their transgression. And indeed, We speak the truth.” (Surah Al-An‘am, 146)

“And remember David and Solomon, when they passed judgment concerning a field of crops, into which the sheep of some people had strayed by night. And We were witnesses to their judgment.” (Surah Al-Anbiya, 78)

HOOPOE BIRD (HUDHUD)

The hoopoe bird has 63 pairs, or 126 diploid chromosomes, in its cells. The number 63 is the 44th composite number.

The verse in which the name “hoopoe bird” (Hudhud) appears contains a total of 44 letters.

“Suleiman inspected the birds and said, ‘Why can I not see the hoopoe bird? Or has it disappeared?’” (Surah An-Naml, 20)

THE MIRACLE OF THE NAME OF ALLAH REVEALED IN A GRAPH CREATED FROM THE VERSE NUMBERS

When we display all the verse numbers of the Qur'an, in sequence from beginning to end, on a graph, the name of Allah that emerges is an unmistakable miracle. Readers who wish to examine the graph in high quality and in detail can visit the book's website. (<https://coktefekkkurederim.github.io/>)

SOURCES WOULD PROPHET MUHAMMAD (PBUH) HAVE NEEDED TO KNOW TO RELATE THE STORIES IN THE QUR'AN

We have the Holy Qur'an, a sacred scripture that the world recognizes as having reached the present day without being corrupted.

We have repeatedly demonstrated with numerous pieces of evidence that the Qur'an could not have been written by a human being.

In this section, dear reader, let us examine together which sources would have needed to be known in order for the stories found in the Qur'an to be known, whether it was possible to access these sources, and whether Prophet Muhammad (PBUH) could have known these sources.

THE CREATION OF ADAM AND THE PROSTRATION OF THE ANGELS

For our Prophet (PBUH) to have been able to relate this event, he would have needed to know "Genesis Rabbah," one of the oldest and most important collections of religious commentaries (Midrash) in Jewish literature, written on the Book of Genesis, the first book of the Torah.

He would also have needed to obtain and know Vita Adae et Evae ("The Life of Adam and Eve") and the Apocalypse of

Moses, two important texts of Jewish-Christian apocryphal literature.

So, could Prophet Muhammad have taken this account from Genesis Rabbah?

Impossible.

The final redaction of Genesis Rabbah is generally dated to the beginning of the 5th century. The lifetime of Prophet Muhammad was 570-632. The text is a Midrash compiled in Palestine in Hebrew/Aramaic; therefore, it would not have been possible for a written copy to have been circulating in Arabia.

The language and style of the Qur'an indicate not "copying" from a written Midrash, but rather oral and cultural transmission.

Genesis Rabbah was written in Hebrew/Aramaic. There is no evidence that Prophet Muhammad could read these languages or that he had access to an Arabic translation of the text. Nor is there any passage in which the account of Adam in the Qur'an corresponds word for word with Genesis Rabbah.

Prophet Muhammad did not know how to read or write (he was ummi), so it would not have been physically possible for him to transmit material from a written source.

Purely theoretically, it may have been possible for him to have learned this account through hearsay. This is because, chronologically, the dates of the revelation of the Qur'an and the writing of Genesis Rabbah are relatively close. However, for this section of the Qur'an to have been written in this way, someone

would have had to take Genesis Rabbah immediately after it was written, hurry to bring it to the Prophet, translate it, and work together with him to reproduce its contents. We must remember that there were no social media or internet in those years, and that people could not become aware of one another's activities or coordinate parallel operations in the way they can today.

Genesis Rabbah would first have had to be written. Then Prophet Muhammad would have had to proclaim his prophethood, Islam would have had to grow, and then the Jews would have had to say, "Let us take our book to Muhammad so that he can use passages from our scripture in his own holy book." Alternatively, Prophet Muhammad (PBUH) would have had to learn about a book whose existence he did not even know about through someone else, then, despite not knowing what was written in it, appoint someone to locate the book, have it translated, have it copied, and accomplish all of this among so many polytheists who were hostile to Islam and constantly watching for an opportunity to find fault.

Theoretically, it is not impossible, but logically and rationally, such a thing is impossible, dear reader.

CAIN AND ABEL

In order to relate this event, it would also have been necessary to know Genesis Rabbah and Midrash Tanchuma, another highly important collection of Aggadic (narrative and theological) commentaries written on the Torah. In addition, one would have needed to know Rabbinic Hebrew, the language in which these works were written, as well as Palestinian Aramaic and Greek/Latin.

It would have been impossible for someone in Arabia who could neither read nor write to know all of these things. At a time when even the number of people in a society who could read and write in Arabic did not exceed the fingers of two hands, and in an age of darkness when people buried their infant daughters alive, it would have been impossible for someone to suddenly emerge, acquire all of these sources, and write a holy book.

NOAH AND THE FLOOD

In order to relate this event, it would also have been necessary to know Genesis Rabbah. Along with the Babylonian Talmud, Pesachim, one would also have needed to know other rabbinic texts. Knowledge of Aramaic and Hebrew would have been necessary as well.

It would have been impossible for someone who could neither read nor write at that time to know all of these sources. Moreover, writing down the Qur'an was not Prophet Muhammad's (PBUH) only responsibility. He was constantly conveying the message to the people around him and was continually involved in wars. He was not merely a religious scholar; he was a leader, and the person whom others consulted before undertaking every matter. There were always Companions around him. If the Companions who believed in him had seen their Prophet reading other books and copying passages from those books, would they have remained by his side even at the cost of their own lives?

The Companions hardly ever left Prophet Muhammad alone to such an extent that there is even a verse revealed specifically because of this situation.

“O believers! Do not enter the homes of the Prophet unless you are given permission and do not wait for the preparation of food. But when you are invited, then enter. When you have eaten, then disperse immediately and do not stay engaged in conversation. Such behavior distresses the Prophet, yet he is too shy to tell you, whereas Allah is not shy to state the truth. When you ask the wives of the Prophet for something, ask them from behind a curtain. This is purer for your hearts and their hearts. You have no right to hurt the Messenger of Allah, nor may you ever marry his wives after him. Indeed, doing so would be a grave sin in the sight of Allah.” (Surah Al-Ahzab, 53)

A person who was almost never left alone would not have had the time to access the ancient sources we have mentioned. He could not, as people can today, wait until everyone had gone at night and then access a source from the other side of the world via the internet. Therefore, both logically and rationally, it is impossible that Prophet Muhammad (PBUH) created the Qur'an by copying it from other sources.

ABRAHAM'S SACRIFICE OF HIS SON

In order for this event to have been related, it would have been necessary to know the Jewish apocryphal work *Liber Antiquitatum Biblicarum*, commonly known as *Pseudo-Philo*, which was written between the 1st century BC and the 1st century AD, toward the end of the Second Temple period, and retells the historiography of the Hebrew Bible.

The original language of the book was Hebrew, but this original source is still lost today. At some point, it was translated into Greek, but that translation has also not survived. The only

translation that has reached us is the Latin translation. The oldest of the Latin manuscripts we possess dates to approximately the 11th century (e.g., the Fulda/Phillipps manuscript, 11th century). In other words, the evidence we have for the physical existence of the text dates to approximately 400 years after the time of Prophet Muhammad (PBUH). Therefore, it would in every respect have been impossible for Prophet Muhammad (PBUH) either to have read or to have heard this text. All known manuscripts have been found in Western Europe, in monastic libraries in regions of Germany, France, and England. There is also no geographical connection with the Near East, Syria, Palestine, or Arabia.

Furthermore, *Liber Antiquitatum Biblicarum* is never mentioned in the Talmud, Midrashic literature, or any rabbinic source. This indicates that the text had completely disappeared from circulation within the mainstream Jewish tradition after the 1st century AD and survived only in Christian circles, particularly in the Latin-speaking West.

For this reason, the text of *Liber Antiquitatum Biblicarum* was never in circulation outside Western Europe.

The fact that it is never mentioned in the rabbinic tradition indicates that the text had broken away from mainstream Judaism at a very early stage, perhaps after the 1st century. Therefore, there is no possibility that the Jewish communities of the Hijaz in the 6th century were aware of it. In other words, our Prophet (PBUH) could not have heard it from the Jews of his own time either.

With these facts, we can also establish that an account found only in the text of *Liber Antiquitatum Biblicarum* could not have originated from any other common source.

The evidence clearly demonstrates that it was also impossible for Prophet Muhammad to have read or heard this source.

Therefore, it is impossible that the passage describing Abraham sacrificing his son was written by a human being.

JOSEPH

In order for the life of Prophet Joseph as described in the Qur'an to have been known, it would theoretically have been necessary to know Genesis Rabbah.

The account of Prophet Joseph in particular is written in a much more detailed, dramatic, and literary manner.

For a person living around the year 600 to have been able to relate these events in such detail, it would have been necessary to know the Torah, the foundational Hebrew text. Knowledge of Hebrew would also have been required.

He would have needed to know Aramaic texts such as Targum Onkelos and Targum Pseudo-Jonathan, which were recited orally and/or read in written form alongside the Hebrew text in synagogues.

He would have needed to know the Midrashic literature, Genesis Rabbah, and collections such as Tanhuma.

He would also have needed to know Syriac Christian literature, particularly the works of Jacob of Serugh. (He wrote a long, poetic mimro [sermon-poem] about Joseph, in which the theme of Zuleikha is strongly developed.)

He would have needed to know the works of Ephrem the Syrian, including his hymns and commentaries concerning Joseph.

He would have needed to know Christian-Jewish apocryphal texts centered on Joseph's moral struggle, particularly the Testament of Joseph, part of the Testaments of the Twelve Patriarchs.

There is no record of Prophet Muhammad having read a Syriac, Hebrew, or Greek text, or of his having engaged in lengthy theological conversations with anyone in these languages. Our Prophet (PBUH) was ummi. Moreover, even the earliest Sīrah (biographical) sources we possess, such as Ibn Ishaq, were written approximately 150 years after the events.

Writers such as Ephrem wrote in Northern Mesopotamia, hundreds of kilometers away from Mecca. There is no evidence that these texts were translated into Arabic.

Dear reader, it is important to note that the possibility that the events described were transmitted orally is not realistic either. We are talking about the possibility that someone, hundreds of kilometers away, learned a large number of writings composed in Syriac, devoted their life to a particular purpose, undertook a long journey, thoroughly memorized and understood these accounts, and translated them in order to relate them to our Prophet (PBUH). Even today, reproducing these events would require many people

to spend years doing so with the technology and access to information available to us.

Why would people separated by hundreds of kilometers suddenly organize themselves for no reason and write a holy book?

For the love of Allah, let us be fair and speak honestly. Even if we assume, for the sake of argument, that revelation did not occur, and that people from different nations, speaking different languages and separated by vast distances, suddenly organized themselves and wrote a holy book, would that not itself be a miracle?

In response to the miracle we have demonstrated through numerous written sources, could there be a more baseless and unsupported argument than saying, “Well, he must have heard it from someone and then written it down”?

If it is really that easy, technology has advanced today and artificial intelligences have become much more powerful. Why don't you write a holy book yourself? If writing a holy book simply by hearing things from others is really that easy, there are 8.3 billion people on Earth. Surely writing just one should not be so difficult?!

MOSES KILLING A MAN IN EGYPT AND FLEEING TO MIDIAN

In order to relate this event, it would have been necessary to know the text of Exodus, whose form was finalized in the 5th-4th centuries BC.

He would have needed to know the Midrashim, the Jewish tradition of religious commentary that interprets, explains, and expands upon sacred texts, particularly the Torah, as well as the Aggadah, the non-legal sections of the Talmud and Midrash containing stories, legends, and moral teachings, especially Shemot Rabbah / Exodus Rabbah and its older layers.

He would have needed to know the Babylonian Talmud, one of the most important religious and legal texts of Judaism. Therefore, he would have needed to know Babylonian Aramaic and Hebrew.

He would have needed to know Antiquities of the Jews (Hebrew: Iudaike Archaialogia), the enormous 20-volume historical work written in Greek by Josephus around AD 93-94 during the reign of the Roman Emperor Domitian.

He would have needed to know Philo (Philo of Alexandria) and the works of other Hellenistic Jewish writers.

He would have needed to know the Septuagint, the Greek translation of the Old Testament, as well as the Syriac (Peshitta) translations.

He would have needed to know the commentaries of the Church Fathers (Origen, Eusebius, Augustine, etc.).

He would have needed to know the Syriac Christian traditions.

He would have needed to know apocryphal texts such as the Cave of Treasures.

In order to read all these sources, he would have needed to know Hebrew, Greek, Syriac, or Aramaic. And in order for him to hear these accounts, scholars fluent in these languages as well as Arabic would have had to translate and transmit all of these texts to him in their entirety.

All of this is not information that could simply be copied from a poem recited by a traveler wandering through the desert. It would have required multiple people to devote a substantial portion of their lives exclusively to this task and to work collectively.

Therefore, this account, too, could in no way have been the product of human beings.

MOSES AND PHARAOH

In order to relate this event, it would have been necessary to know the text of Exodus, whose form was finalized in the 5th-4th centuries BC.

He would have needed to know the Aramaic interpretive translations, such as Targum Onkelos and Targum Pseudo-Jonathan, which were read aloud in synagogues for people who did not know Hebrew. He would also have needed to know the legends of Jannes and Jambres.

He would have needed to know the late compilations and narratives such as Shemot Rabbah and Sefer ha-Yashar.

He would also have needed to know Josephus's *Antiquitates Judaicae* (*Antiquities of the Jews*), Book 2, a Jewish-Hellenistic

source that gives an expanded account of the life of Moses and includes additional episodes not found in the Torah, such as Moses' expedition to Ethiopia.

He would likewise have needed to know Artapanus, another Jewish-Hellenistic source containing legendary expansions that associate Moses with Egyptian culture.

From Christian/Syriac sources, he would have needed to know writers such as Ephrem the Syrian, Jacob of Serugh, and Narsai, as well as all the works they composed.

DAVID AND GOLIATH

In order to relate this event, it would have been necessary to know Samuel, one of the most fundamental Jewish sources (the Torah/Tanakh).

It would also have been necessary to know the Book of Judges, one of the books of the Old Testament (Torah/Tanakh).

Collections such as Genesis Rabbah and Leviticus Rabbah would also have needed to be known.

It would have been necessary to know Liber Antiquitatum Biblicarum by Pseudo-Philo. ("Pseudo-Philo" means "false Philo" or "the supposed Philo," referring to a work attributed to Philo even though its actual author is unknown.)

The accounts of Ephrem the Syrian and other Syriac commentators would also have needed to be known.

QARUN

In order to relate this event, it would have been necessary to know the Babylonian Talmud.

Pesachim and Midrash Tanhuma would also have needed to be known.

Numbers Rabbah 18 and Josephus's *Antiquitates Judaicae* (*Antiquities of the Jews*), Book 4, would also have needed to be known.

THE SEVEN SLEEPERS

In order to relate this event, it would have been necessary to know the legend of the saints known as the "Seven Sleepers of Ephesus."

It would have been necessary to know Jacob of Serugh's *mimro* (verse sermon), "Homily on the Youths of Ephesus," or its Greek version by Symeon Metaphrastes, as well as earlier Greek hagiographical sources, or the *Passio Septem Dormientium* recorded by Gregory of Tours.

Knowledge of Syriac, Greek, or Latin would have been necessary.

DHUL-QARNAYN

In order to relate this event, it would have been necessary to know the Syriac Alexander Legend (Neṣḥānā), which was written in Northern Mesopotamia, probably by a Syriac Christian, around 629-630. If we pay attention to the date, it was written almost immediately after the revelation of the Qur'an.

It would have been necessary to know the Talmud (Yerushalmi, Avodah Zarah).

It would have been necessary to know the Book of Daniel from the Old Testament (Torah/Tanakh).

It would also have been necessary to know the Alexander Romance, a Greek/Hellenistic source attributed to Pseudo-Callisthenes and translated into Syriac, Armenian, and Ethiopic.

He would have needed to know Syriac, Armenian, Ethiopic, or Ancient Greek.

JESUS MAKING A BIRD FROM CLAY

In order to relate this event, it would have been necessary to know the Infancy Gospel of Thomas, an apocryphal text written in the 2nd century AD. Therefore, knowledge of Greek would also have been necessary.

MARY'S BIRTH SCENE AND THE DATE PALM

In order to relate this event, it would have been necessary to know the Protoevangelium of James, a highly influential apocryphal text written in the 2nd century AD that describes Mary's birth, childhood, betrothal, and the birth of Jesus. Therefore, knowledge of Koine Greek would have been necessary. If we also take into account later translations, knowledge of Syriac, Coptic, Armenian, Georgian, Ge'ez (Ethiopic, Abyssinia), or Old Church Slavonic would also have been necessary.

JONAH

In order to relate this event, it would have been necessary to know the Book of Jonah (Tanakh/Old Testament) as the primary source. Therefore, it would have been necessary to know the original Torah.

The Gospel of Matthew (12:39-41 and 16:4) and the Gospel of Luke (11:29-32) would also have needed to be known.

It would have been necessary to know Pirke de-Rabbi Eliezer, a Jewish Midrashic compilation.

It would have been necessary to know the Talmud and the Targum of Jonah, and therefore to know Aramaic.

The hymns and sermons of Ephrem the Syrian and Jacob of Serugh would also have needed to be known.

JOB

In order to relate this event, it would have been necessary to know the Book of Job (Tanakh/Ketuvim) as the primary source.

It would have been necessary to know the Testament of Job, a Jewish apocryphal text generally dated to around the 1st century AD.

It would have been necessary to know Genesis Rabbah, Exodus Rabbah, as well as the Talmud, Bava Batra. Therefore, one would also have needed to be familiar with the Aggadic and Midrashic traditions.

It would have been necessary to know Ephrem the Syrian's Commentary on Job.

One would have needed to be familiar with the Eastern Syriac (Nestorian) traditions and know their liturgies and sermons.

It would also have been necessary to know the Epistle of James, a text found in the Christian New Testament (the Bible).

Dear reader, all of the sources I have mentioned were identified as a result of collective research and brought to light through organizations involving enormous effort. These are academic projects spanning 17 years. Since I do not want to overwhelm the book with academic language, I am trying to keep it as simple as possible. If anyone wishes to investigate these studies in depth, they can begin their research with *Texte aus der Umwelt des Korans*.

The project in question was actually initiated with the aim of proving that the Qur'an was written by Prophet Muhammad. When you visit the website of this project, called *Corpus Coranicum*, you will see the following: more than 500 environmental texts that Prophet Muhammad would supposedly have needed to know in order to write the Qur'an are listed. Here, we have dealt only with the stories mentioned in the Qur'an.

In addition, he would have needed advanced knowledge of different fields, such as mathematics for the mathematical miracles and genetics for chromosome numbers. The Qur'an contains information related to almost every branch of science that would have been impossible to know at that time. Given this situation, I will leave the rest for you to consider. From this perspective, our Prophet (PBUH) would have needed to possess advanced knowledge in virtually every subject.

To summarize this section, we are talking about a collection of more than 500 sources in which simply identifying, researching, and bringing together the stories found in written and printed books has taken more than 17 years and involved more than 40 researchers, even with today's technology. In order even to collect and read all the sources necessary to write only the stories found in

the Qur'an, one would have needed to know 10 to 12 different languages and 10 to 12 different cultures and traditions. The texts that would have needed to be read and known fill pages and pages. This is impossible, dear reader.

Writing such a flawless and highly detailed holy book simply by bringing together things heard here and there is already something that cannot be accepted rationally or logically. It would not have been possible.

Even if, hypothetically, he had undertaken such an enormous task, which would have required serious work and effort, the hundreds of Companions around him and the hundreds of polytheists would have witnessed it. We must also remember that there were virtually no people in Mecca who knew how to read and write at that time. Being literate and owning books were extremely rare and luxurious experiences in those days.

To see all these realities and still refuse to believe is like knowingly throwing oneself into the fire.

Even with today's information and communication technologies, we cannot write a holy book. Yet to believe that an ummi person living in the deserts of Arabia around the year 600, in an environment with extremely limited access to sources, could have written a holy book is a belief that is utterly contrary to reason and logic.

“If you are in doubt about what We have revealed to Our servant (Muhammad), then produce a surah like it and call your witnesses other than Allah, if you are truthful.” (Surah Al-Baqarah, 23)

THE MIRACLE OF THE EXPANSION OF THE UNIVERSE

Humanity first discovered that the universe is expanding in 1929.

Edwin Hubble was using the Hooker Telescope at the Mount Wilson Observatory in California, which was the largest telescope of its time. First, he determined the distances of the galaxies. Then he examined the spectra of the light coming from the galaxies. He observed that the light was redshifted.

Hubble realized the following: Nearby galaxies have less redshift. More distant galaxies have greater redshift.

And he reached this conclusion: The farther away a galaxy is, the faster it is receding.

The Qur'an was revealed between 610 and 632.

“And the heaven We constructed with strength, and indeed, We are its expanders.”

(Surah Adh-Dhariyat, 47)

A mind that does not want to believe may come up with an excuse for some of the miracles within the Qur'an, such as the alignment of the Names of Allah. They may try to escape from a truth they are afraid to accept by explaining it away with arguments such as, “One line was compressed, and that is why they became aligned.”

However, there cannot even be an excuse fabricated for this miracle.

These words could not have been heard and written down from a poet, a traveler, or any source.

There is an objection raised concerning this matter. It is argued that the word “Mūsi‘ūn” does not only mean “We are expanding,” but can also mean “We possess power” or “We are the ones who grant abundance.”

“It is He Who has sent down to you the Book. Some of its verses are Muhkam, meaning that these verses are the foundation of the Book. And others are Mutashabih. Those whose hearts have deviation follow the Mutashabih verses, seeking to cause discord and seeking an interpretation according to their own desires. Yet no one knows its interpretation except Allah. And those firmly grounded in knowledge say, ‘We believe in it; all of it is from our Lord.’ And none take heed except those endowed with understanding.”

(Surah Al ‘Imran, 7)

Muhkam verses: Verses whose meaning is clear and whose ruling is explicit.

Mutashabih verses: Verses that are open to more than one interpretation and contain deep or less apparent meanings.

Dear reader, this is a world of trial. We live in a life in which what is essentially true or crooked within the hearts is brought to

light. There is no matter here of trying to convince those who do not believe. We are merely stating what is here.

A person who does not believe is almost waiting to shake hands with the angels in order to believe. But once the veil of the examination is lifted, and once a person reaches a state in which they can no longer deny even if they wanted to, would there still be anything left called a test?

“And they say, ‘Why is an angel not sent down to him?’ If We had sent down an angel, the matter would surely have been settled, and they would not have been given even a moment’s respite. (They would have been immediately destroyed.)”

(Surah Al-An‘am, 8)

THE MIRACLE OF LIVING BEINGS BEING CREATED FROM WATER

The scientific and quantitative establishment of the idea that water is a fundamental component of living beings and cells took place in the mid-19th century (1838–1860s).

The discovery that water is a compound was made in 1781–1783 by Henry Cavendish and Antoine Lavoisier. By demonstrating that water was not a fundamental element, but a chemical compound consisting of hydrogen and oxygen, they paved the way for biochemical analyses.

Cell theory was first formulated in 1838–1839 by Matthias Schleiden and Theodor Schwann. By explaining that all living beings are composed of cells, the researchers established the cell as the fundamental unit of life.

The identification of protoplasm (the living and dynamic primary substance within the area enclosed by the cell membrane) was made in 1840–1846 by Félix Dujardin, Jan Evangelista Purkyně, and Hugo von Mohl.

By 1861–1868, Max Schultze and Thomas Henry Huxley had shown that protoplasm was common to all plant and animal cells. The first quantitative biochemical analyses conducted in the 1860s established that the cellular contents (protoplasm) consisted of approximately 70 to 90 percent water in the form of a colloidal solution, and that life takes place in a watery environment.

The Qur'an, which was revealed between 610 and 632, informed humanity of this fact 1,200 years before science and humanity discovered it. At that time, examining cells was impossible. Therefore, there was neither a written nor an oral source from which this information could have been obtained. For this reason, the accusation of copying cannot be made either.

“Have those who disbelieved not seen that the heavens and the earth were joined together, and We separated them? And We made from water every living thing. Will they not then believe?” (Surah Al-Anbiya, 30)

“Allah created every living creature from water. Among them are those that crawl on their bellies, those that walk on two legs, and those that walk on four. Allah creates whatever He wills. Indeed, Allah has power over all things.” (Surah An-Nur, 45)

THE MIRACLE OF MOUNTAINS CONTINUING BENEATH THE EARTH AND THE MOVEMENT OF MOUNTAINS

The scientific development of the idea that mountains have roots extending beneath the Earth's surface, as well as the idea that mountains move, took place gradually.

In 1855, the English astronomer and physicist George Biddell Airy proposed that mountains are not merely masses of rock rising above the Earth's surface, but may have lower-density “roots” extending deeper beneath the ground. Airy's approach formed the basis of what later became known as the “Airy model of isostasy.”

In 1859, the English mathematician and physicist John Henry Pratt developed a different model of isostasy from Airy's model. Thus, scientific studies aimed at explaining why mountains and continental crust exist in a state of equilibrium began to develop.

Toward the end of the 19th century, geodetic measurements and gravity anomalies provided important evidence suggesting that mountainous regions were not composed merely of masses of rock located at the surface. In particular, measurements of lower-than-expected gravitational values in some mountainous regions strengthened the idea that deep structures with different densities might exist beneath the Earth's surface.

With the development of seismology and geophysical methods in the 20th century, the Earth's internal structure began to be investigated in much greater detail. The study of how earthquake waves behave as they travel through the Earth provided much more direct information about the thickness and structure of the Earth's crust than had been available in previous periods.

From the middle of the 21st century onward, seismic investigations provided much stronger evidence for the existence of thickened continental crust and deep structures beneath major mountain belts. Thus, from the perspective of modern geophysics, it was firmly established that mountains are not composed solely of the portions visible at the surface, but have deep structures extending beneath the Earth's surface in connection with their formation.

In short, the important turning point in the modern scientific theory concerning the existence of roots beneath mountains was Airy's work in 1855; the much stronger observational and geophysical evidence for these structures emerged particularly during the 20th century.

First of all, during the 19th century, geologists began to understand that the Earth's surface was not fixed and unchanging, and that mountains formed, rose, and changed over time. However, the idea that mountains and continents moved horizontally across the Earth was not yet accepted.

In 1912, the German meteorologist and geophysicist Alfred Wegener proposed that the continents had once formed a single great landmass and had subsequently moved away from one another. This theory became known as "continental drift." Wegener

argued that the continents were still moving in the present day. However, because the mechanism capable of moving the continents could not be adequately explained at that time, his theory remained controversial for many years.

In the 1950s and 1960s, much stronger evidence was obtained through the discovery of seafloor spreading, paleomagnetic data, and mid-ocean ridges. As a result, it was understood that the Earth's crust consists of large plates and that these plates are continuously moving.

By the late 1960s, the modern theory of plate tectonics had gained general acceptance. It was thus scientifically established that the continental crust on which mountains stand also moves together with these plates, and that the mountains themselves rise and change as a result of plate collisions and tectonic processes.

Therefore, regarding the tectonic movement of the landmasses on which mountains are located, the important turning point in the scientific explanation of this phenomenon was Wegener's theory of continental drift in 1912. Its modern and comprehensive explanation was established with the development of plate tectonics in the 1960s.

The Qur'an, which was revealed between 610 and 632, conveyed, approximately 1,300 years ago, the reality that humanity would only discover between 1850 and 1912.

“Have We not made the earth a resting place, and the mountains as stakes?” (Surah An-Naba, 6–7)

“You see the mountains and think them motionless, while they pass like the passing of clouds. This is the work of Allah, Who has perfected all things. Surely, He is All-Aware of what you do.”
(Surah An-Naml, 88)

THE MIRACLE OF THE STAGES OF EMBRYONIC DEVELOPMENT

The cell was first discovered in 1665, when a scientist named Robert Hooke used a microscope. Sperm was discovered in 1677, and the egg cell was discovered in 1827.

The process of fertilization was first observed in 1875 by a scientist named Oscar Hertwig.

The stages through which the embryo passes day by day and week by week after fertilization could only be definitively standardized in the mid-20th century.

Scientists such as George Streeter and Ronan O'Rahilly mapped the development of the embryo during the first eight weeks after fertilization, dividing it into 23 standardized stages for the first time between 1942 and 1987.

In 1950–1955, with the use of ultrasound during pregnancy, it only became possible to begin observing the living stages of the baby inside the womb in real time and without harm.

The Qur'an, however, described the stages of embryonic development 1,300 years before humanity discovered the development of embryos.

“And indeed, We created man from an extract of clay. Then We placed him as a drop of fluid (semen) in a secure place of settlement (the mother's womb). Then We created the nutfah into

an ‘alaqah (embryo), then We created the ‘alaqah into a mudghah (a lump of flesh as though it had been chewed), then We created the mudghah into bones, then We clothed the bones with flesh, and thereafter We brought him into being as another creation. So Blessed is Allah, the Best of Creators.”

(Surah Al-Mu’minun, 23:12–14)

At the time when the Qur’an was revealed, there were neither microscopes nor ultrasound. Therefore, this description could not in any way have been written by copying it from a source or based on information obtained through observation.

THE MIRACLE OF IRON

Humanity's encounter with iron and its realization that it came from the heavens first emerged in 1794, when Ernst Chladni scientifically demonstrated that meteorites came from outer space. Subsequent chemical analyses confirmed that, unlike iron ore found on Earth, meteoric iron contains at least 5% to 30% nickel, as well as crystallized Widmanstätten patterns.

In the 1950s, the studies conducted by Fred Hoyle, Margaret Burbidge, and their team on stellar nucleosynthesis revealed the nature of the iron atom.

The iron nucleus has the highest binding energy among the nuclei involved in fusion reactions. The temperature and pressure during the formation of the Earth were insufficient to transform hydrogen or helium into iron. Therefore, the iron atoms in the universe could only have been formed in massive stars and through supernova explosions, after which they were scattered into space. All the iron found on Earth has reached our planet as the remnants of stars that exploded billions of years ago. Humanity discovered this information in 1794, yet the Qur'an had stated it 1,200 years earlier.

“Indeed, We sent Our messengers with clear proofs, and We sent down with them the Book and the Measure so that people may uphold justice. And We sent down iron, in which there is great strength and benefits for people. This is so that Allah may make evident those who support His religion and His messengers without seeing Him. Surely, Allah is Powerful, Almighty.”(Surah Al-Hadid, 57:25)

THE MIRACLE OF THE SEAS NOT MIXING

The fact that seas (or different bodies of water) do not immediately mix into a completely homogeneous mass was discovered and conceptualized in the modern scientific sense during the late 19th century and the early 20th century, with the birth and development of the discipline of oceanography.

The formation of distinct boundaries between seawater masses due to differences in specific gravity, salinity, temperature, and density (halocline and thermocline layers) was first documented on a large scale through scientific data during the Challenger Expedition (1872–1876).

The first comprehensive modern oceanographic research expedition in maritime history was the HMS Challenger Expedition (1872–1876). Measurements taken at different depths of the seas and at points where water masses meet demonstrated that temperature, salinity, and density vary within seawater. As a result, when different bodies of water come into contact, they do not immediately mix with one another.

In the early 20th century, Scandinavian scientists, particularly Bjørn Helland-Hansen and Fridtjof Nansen, formulated that water masses can move separately from one another both chemically and physically, and that boundaries based on fluid dynamics can form between them. This reality, discovered by humanity in 1872, was revealed by the Qur'an 1,250 years earlier.

“He released the two seas, meeting together. Between them is a barrier which they do not transgress.”(Surah Ar-Rahman, 55:19–20)

“And it is He Who has released the two bodies of water: one fresh and sweet, and the other salty and bitter; and He placed between them a barrier and a forbidding partition.”(Surah Al-Furqan, 25:53)

“Or Who made the earth a stable abode, placed rivers throughout it, set firm mountains upon it, and placed a barrier between the two seas? Is there any deity besides Allah? Rather, most of them do not know.”(Surah An-Naml, 27:61)

Dear reader, one should never forget that while making such a serious claim and bringing about such a profound transformation, the Prophet Muhammad ﷺ could not have risked his mission in this manner. We have already established the miracle itself. Those who believe already accept these miracles; however, even from the perspective of a non-believer, an apparent miracle of this nature would allow no room for error.

From the perspective of someone who does not believe, if it is claimed, Allah forbid, that the Prophet Muhammad ﷺ merely took a risk and invented this statement himself, that explanation is not logical either. Seas either mix immediately or they do not. There would have been a fifty-percent chance of being wrong.

Could such an enormous risk be taken in a matter of such gravity? It is not reasonable. One would not take such a tremendous risk when everything could collapse if the claim proved false.

THE MIRACLE OF THE PROPHET MUHAMMAD'S (PBUH) AGE AT DEATH

In the Qur'an, we see the phrase "if We cause you to die" addressed to the Prophet Muhammad (PBUH) in three places.

"Whether We show you part of what We threaten them with, or We cause you to die, to Us is their return. Then Allah is Witness over what they do." (Surah Yunus, 10:46)

"Whether We show you part of what We have promised them, or We cause you to die before that, your duty is only to convey the message, and upon Us is the reckoning." (Surah Ar-Ra'd, 13:40)

"So be patient. Indeed, the promise of Allah is true. Whether We show you part of what We threaten them with, or We cause you to die, they will surely be returned to Us." (Surah Ghafir, 40:77)

Surah Yunus is the 10th chapter. The Prophet's (PBUH) period of conveying the message in Madinah lasted 10 years.

Surah Ar-Ra'd is the 13th chapter. The Prophet's (PBUH) period of conveying the message in Makkah lasted 13 years.

Surah Ghafir is the 40th chapter. The Prophet Muhammad (PBUH) received the mission of Prophethood at the age of 40.

When these three numbers are added together, the result is 63.

The Prophet Muhammad (PBUH) passed away at the age of 63.

It would be impossible for a person to arrange the age at which he would die in such a way as to construct a book around it. This is therefore a clear miracle.

THE QUR'AN'S CHALLENGE AND THE MIRACLE OF ABU LAHAB

Abu Lahab was the uncle of Prophet Muhammad (peace and blessings be upon him) and one of the fiercest opponents of Islam during the Makkan period. His real name was Abd al-Uzza ibn Abd al-Muttalib. He came from a wealthy and powerful family, possessed considerable social influence, and was far more experienced than an ordinary resident of Makkah.

Surah Al-Masad (Surah Tabbat) was revealed while Abu Lahab was still alive. After this Surah was revealed, Abu Lahab continued to live for approximately another 7 to 10 years and died in 624 CE, shortly after the Battle of Badr.

“May the hands of Abu Lahab perish, and perish he did. Neither his wealth nor his gains benefited him. He will burn in a blazing Fire, and his wife as well, the carrier of firewood, with a rope of twisted palm-fiber around her neck.” (Surah Al-Masad)

The Qur'an gave direct, explicit, and unequivocal information about the future of Abu Lahab.

When Surah Al-Masad was revealed, Abu Lahab was still alive. He was powerful, influential, and one of the most active enemies of Islam. It is an undeniable fact that in such heated circumstances, people seize even the smallest opportunities to refute a claim. Despite this, throughout the years that followed, Abu Lahab never publicly declared, even outwardly, that he had accepted Islam.

At that time, hostility toward Islam had grown so intense that the leaders of the tribes were forming councils and discussing what measures they could take, regardless of the consequences. Decisions were even made to kill the Prophet (peace and blessings be upon him). Every possible method was being tried.

In such an environment, if Abu Lahab had stood up and said, even falsely, “I have accepted Islam; the Qur’an was mistaken,” it could have dealt a tremendous blow to Islam and could have instantly undermined the mission of the Prophet Muhammad (peace and blessings be upon him). Yet he did not do so.

This was not due to a lack of knowledge or because the idea never occurred to him, for Abu Lahab was regarded as a knowledgeable man, especially by the standards of his time.

According to the Qur’an, one of the greatest barriers that prevents a person from accepting the truth is arrogance. Arrogance does not mean that a person cannot see the truth; rather, it means refusing to submit to the truth despite recognizing it. This is also the model of Pharaoh described in the Qur’an. Although Pharaoh witnessed the signs brought by Musa (Moses), he resisted because he did not want to lose his authority and claim to superiority. In a similar way, Abu Lahab chose to remain attached not merely to an idea, but to his own ego and social status.

Human beings often reject the truth not because they fail to understand it, but because it does not suit their interests. If accepting the truth threatens a person's pride, position, habits, or worldly interests, the lower self (nafs) moves into defense. For this reason, the Qur’an repeatedly speaks of hearts being sealed, of

people who have eyes but do not see, and ears but do not hear. The problem is not that the intellect fails to function, but that the heart refuses to submit.

Through Surah Al-Masad, Allah (Glorified and Exalted is He) openly issued a challenge. If the Qur'an had been written by a human being, it would have been impossible to take such a great risk. For everything would have depended on a single individual disproving it.

As time passed, it became evident that everything occurred exactly as the Qur'an had stated. In this respect, the very style of the Qur'an also became evidence for the existence of Allah, because it spoke with certainty and in a manner that left no room for doubt, while openly issuing a challenge.

This miracle of the Qur'an does not stop there; it also provides guidance for humanity. Abu Lahab is not merely an individual, but also represents a mindset. He symbolizes the type of person who hears the truth yet turns away from it, who places trust in wealth, children, intelligence, power, and worldly possessions, who places social status, habits, and comfort above the pleasure of Allah, and who deifies his own desires. In this sense, he also serves as a warning to humanity.

“Have you seen the one who has taken his own desire as his god, and whom Allah has led astray despite knowledge, and upon whose hearing and heart He has set a seal, and over whose sight He has placed a veil? Who then can guide him after Allah? Will you not then take heed?” (Surah Al-Jathiyah, 23)

“Have you seen the one who has taken his own desire as his god? Will you then be a guardian over him?” (Surah Al-Furqan, 43)

We cannot guide the Abu Lahabs to hidayah. We can only convey the truth and warn people, just as we are doing here now.

THE MIRACLE OF THE FLY'S EXTERNAL DIGESTION

It began to be observed in the early 1900s that flies do not directly chew solid substances but instead consume liquefied food. In 1915, the first detailed monograph on the structure, habits, and feeding behavior of the fly was published.

Between 1920 and 1950, digestive enzymes in insects began to be studied. In 1955, strong proteolytic activity at low pH was discovered in the larvae of the housefly.

In 1976, the distribution of digestive enzymes in the gut and salivary glands of the housefly (*Musca domestica*) was experimentally investigated.

During the 1980s, it was established in detail where and how enzymes such as amylase, trypsin, lysozyme, and pepsin function within the fly's digestive system.

After the 2000s, science clearly documented that the housefly is capable of liquefying solid or semi-solid food by means of saliva and regurgitated digestive material, and then absorbing it.

External digestion is the process by which a fly begins breaking down food outside its own body. A fly does not chew and swallow food as we do. It releases special digestive fluids onto the food. The enzymes within these fluids break down hard tissues or proteins into smaller components. In other words, the food begins to be "dissolved" externally. The fly then absorbs this liquefied

nourishment. In humans, however, the situation is different. We place food into our mouths, chew it, and digest it primarily within our digestive system through digestive enzymes. In short, external digestion is the method of "first breaking down the food outside, then taking in the resulting nutrients." Therefore, if a fly has deposited its secretion on something (if it has taken hold of something), we cannot restore it to its original state.

Consider how the Qur'an pointed to the phenomenon of the fly's external digestion, which humanity only came to discover after 1920, more than 1,300 years ago:

"O people! An example is presented, so listen to it carefully: Indeed, those whom you invoke besides Allah can never create even a fly, even if they gathered together for that purpose. And if the fly snatches something away from them, they cannot recover it from it. Weak are the seeker and the sought." (Surah Al-Hajj, 22:73)

The human being, who places so much confidence in himself, is in reality so helpless that he does not possess the power even to recover what a fly has taken away.

O reader, whose power does not extend even to a fly, will you still refuse to turn to your Lord, still persist in arrogance, and still continue challenging your Lord?

...

...

Do not.

THE MIRACLE OF THE TARIQ STAR

Linguistically, Tāriq is derived from the root t-r-q, in the pattern of barq, and carries the meaning of striking and knocking. In Arabic, a road is called ṭarīq because it contains this meaning, as it is continuously trodden and stamped upon by the feet of travelers who come and go. The Arabic word miṭraqah (hammer) is also derived from the same root because iron and similar materials are struck with it.

At night, people lock the doors of their homes so that no one may enter. Therefore, if someone wishes to enter one of these locked houses during the night, he must knock on the door. A person who knocks on a door at night is called a Tāriq in Arabic. He is given this name because his action involves knocking or striking.

“By the heaven and the Tariq.

And what will make you know what the Tariq is?

It is the piercing star.”

(Surah At-Tariq, 86:1-3)

In the third verse, the Qur'an uses the expression “An-Najmu's-Sāqib”.

The word Sāqib is etymologically derived from the root s-k-b.

The root s-k-b carries the meaning of piercing.

Humanity's discovery of the Tariq stars (Pulsars) is one of the most fascinating and coincidence-filled turning points in the history of astronomy.

In the summer of 1967, Jocelyn Bell Burnell, a graduate student at the University of Cambridge, and her supervisor Antony Hewish built a massive radio telescope array to study interplanetary scintillations.

While manually examining meters-long paper chart recordings every day, Jocelyn Bell noticed a strange signal coming consistently from the same point in the sky. The signal contained extremely regular radio pulses that repeated themselves with perfect precision every 1.33 seconds. At that time, no natural celestial object exhibiting such a flawless rhythm was known.

This regularity was so astonishing that the team initially considered the possibility that it might be a message from an intelligent extraterrestrial civilization. For this reason, they jokingly named the signal LGM-1, meaning "Little Green Men 1."

However, when similar rhythmic signals were later detected from different regions of the sky, this possibility was ruled out, and it became clear that the phenomenon was a natural cosmic event.

Mathematical and physical calculations demonstrated that these signals originated from extremely dense neutron stars left behind by supernova explosions and rotating around their own axes at extraordinary speeds. Just as a lighthouse emits light at regular

intervals while rotating, these stars were emitting radio waves into space.

When the discovery was published in the journal *Nature* in 1968, it created a tremendous impact in the scientific world. For the first time, neutron stars, whose existence had been predicted theoretically but had never been observed, were conclusively confirmed.

This historic discovery was also recognized with the Nobel Prize in Physics in 1974.

The Qur'an, which mentioned the Tariq star 1,300 years before humanity discovered it, has presented a clear miracle.

Even if minds unwilling to believe attempt to produce excuses for some miracles, this miracle cannot be dismissed with excuses.

Who could have known at that time that a neutron star (the Tariq star) produces a sound resembling a knock on a door?

Who could have known how this star, unlike other stars, pierces through the darkness?!

The Qur'an is the Word of Allah.

It cannot have been written by a human being.

You can listen to this sound produced by a neutron star by searching the terms "Tariq star sound" or "The Star that Knocks on the Door" on the internet.

TO DO SOMETHING NEW AND DIFFERENT, ONE MUST KNOW EVERYTHING

If I were to give you a dictionary containing 100,000 words and ask you to add a new and different word to it every day, then in order for you to add a truly new and different word each day, you would first have to know all 100,000 words in that dictionary completely and without error. Wouldn't you?

Both fingerprints and the retinal layer are entirely unique in every human being on Earth. Even identical twins, despite having the same DNA, possess different fingerprints and different retinal structures.

There are currently 8.3 billion people in the world. Therefore, there are 24.9 billion completely distinct fingerprints, retinas, and faces.

The number of births worldwide is approximately 360,000 per day. Consequently, every day, 1,080,000 entirely different fingerprints, retinas, and faces come into existence.

The One who creates 1,080,000 different fingerprints, retinas, and faces must also know the 24.9 billion different fingerprints, retinas, and faces that already exist.

When we also take into account the 109 billion people who have lived from the past until the present, there are a total of 327 billion different fingerprints, retinas, and faces that must be known.

Can lifeless, unintelligent, unconscious matter know all of this?

Knowledge requires life. Therefore, matter cannot know these countless distinct codes. Neither can a living human being nor a living animal possess such knowledge.

This means that there must be a Power that is living, conscious, possessing knowledge, capable of design, able to bring things into existence in harmony, able to give life, able to give form, and able to create for a purpose.

All of these conditions inevitably compel the mind toward a Power that creates everything with wisdom.

Whatever Power brings into existence 1 quintillion (1,000,000,000,000,000,000) flies every year across 150,000 different species; whatever Power brings into existence 2 trillion galaxies; that same Power is the One who knows 327 billion different retinas, fingerprints, and faces, and who continues every day to bring into existence 1,080,000 entirely different fingerprints, retinas, and faces.

“Say, ‘Are there any of your partners whom you associate with Allah who originates creation and then repeats it?’ Say, ‘Allah originates creation and then repeats it. So how are you deluded away from the truth?’”

(Surah Yunus, 10:34)

THE FINE-TUNING OF THE UNIVERSE

There is a common misconception that has remained in people's minds:

"If the Sun were one centimeter closer to Earth, we would burn; if it were one centimeter farther away, we would freeze."

In reality, as the Earth travels along its elliptical orbit, it moves approximately five million kilometers closer to and farther from the Sun. Therefore, this claim is not correct. However, scientists have discovered far more remarkable examples of fine-tuning in the universe.

One of these is the electromagnetic force. It is the force that enables atoms to exist by allowing electrons to orbit protons. Without this electromagnetic force, atoms could not form. Chemical bonds would not exist, and neither would light. The values of these forces must be extraordinarily precise. For example, if the gravitational constant were decreased by one part in 10^{60} , meaning by a single unit in a number with sixty zeros after the one, no planet larger than a football could have formed anywhere in the universe.

What if it had increased by 10^{60} ?

In that case, large planets would exist, but the strength of gravity would make life impossible.

Scientists say:

"Place a single coin anywhere in the universe and fire a bullet randomly in any direction. Assume the bullet never loses speed and continues indefinitely. The probability of hitting that coin is higher than the probability of the gravitational law having arisen by chance."

I hope you can grasp just how delicately balanced this value is. It means that such a balance could not have arisen randomly.

Beyond the scientists who accept a Creator, there are also scientists who do not accept a Creator, yet still acknowledge this fine-tuning.

"If the rate of expansion one second after the Big Bang had been smaller by even one part in a hundred thousand million million, the universe would have recollapsed before it ever reached its present size. The remarkable fact is that the values of these numbers seem to have been very finely adjusted to make possible the development of life."

Stephen Hawking (Physicist and Cosmologist)

"Yes, that's true. The value you're talking about really is balanced on a knife's edge. It is so delicate that if you were to alter it even slightly, we would not be here. Whatever created the universe, I do not like saying 'whatever created it'; rather, whoever created it set these constants with extraordinary precision."

Prof. Leonard Susskind (Physicist)

"I would call it the 'God explanation.' The reason is not the multiverse or anything like that. The reason is the partial fine-tuning we observe in the universe. As we mentioned earlier, one of the possible explanations is theism, according to which everything has been set by a Designer."

Prof. George F. R. Ellis (Astrophysicist)

In every miracle we have presented, we encounter probabilities so small that they are practically impossible. On one side stands a Creator who brings everything into existence perfectly through His knowledge and power. On the other side stand probabilities such as 10^{60} or 10^{300} , odds so inconceivably small that they can scarcely even be expressed. O human being, preoccupied with your stomach and your comfort, will you still persist in denial?

THE MIRACLE OF THE STAR SIRIUS

The name of the fifty-third surah of the Qur'an is An-Najm. Najm is a word of Arabic origin and fundamentally means "star."

"And that He is indeed the Lord of Sirius." (Surah An-Najm, 49)

Sirius is the first star to be mentioned by name in the Qur'an. The star known as Shi'ra in Arabic is known in Western languages as Sirius, or the Dog Star, and is the brightest star in the night sky. It is located in the constellation Canis Major.

"By the star when it sets," (Surah An-Najm, 1)

"Those who avoid major sins and immoralities, except for minor faults, indeed your Lord is vast in forgiveness. He knows you best when He brought you forth from the earth and when you were fetuses in the wombs of your mothers. So do not claim yourselves to be pure. He knows best those who are mindful of Him." (Surah An-Najm, 32)

"Those who avoid great sins and shameful deeds, only (falling into) small faults, verily thy Lord is ample in forgiveness. He knows you well when He brings you out of the earth, and when ye are hidden in your mothers' wombs. Therefore justify not yourselves: He knows best who it is that guards against evil." (Surah An-Najm, 32)

In verse 32 of Surah An-Najm, the word “earth” appears. In English, the Turkish word toprak is expressed by the word “earth.” The word “earth” can mean the world, the land, or soil.

There are exactly 861 letters between the word “star” mentioned in verse 1 of Surah An-Najm and the word “earth” mentioned in verse 32.

So, how far away is the Earth from the star Sirius?
2.64 Parsec.

Could this miracle possibly have been the work of human hands, dear reader? Once, it happened to coincide; twice, it happened to coincide; three times, it happened to coincide... Could all of it be mere coincidence? Could all of it simply have fallen into place by chance?

Even when one witnesses only the miracles that we have explained here in such a simple manner, one cannot help but shudder. Perhaps, in some way, you have truly overlooked these things until now. Do not worry; you can still repent. You still have a chance to save yourself. As long as you are alive, it is not too late for anything, dear reader. Repent and turn towards your Lord.

THE MIRACLE OF THE SKY TURNING INTO A RED ROSE

“And when the sky is split open and becomes a rose-red color, like molten oil...” (Surah Ar-Rahman, 37)

Hundreds of years ago, humanity could neither know nor understand what these words meant. However, 1,300 years after the Qur'an was revealed, we are able to see what this verse points to. We can witness this scene, which is described in the verse through metaphors such as something resembling molten oil, like an oil painting, like molten metal, or like molten skin. (Rosette Nebula)

If this is not a miracle, then what is? If this is not evidence of the existence of Allah, then what is?

THE MIRACLE OF THE BOILING SEAS

“And by the Mount, and by a Book inscribed upon a spread-out parchment, and by the frequented House, and by the raised ceiling, and by the boiling sea, surely the punishment of your Lord will come to pass. There is none who can prevent it.”

(Surah At-Tur, 52:1–8)

In the year 610, the boiling of the sea might have been imaginable, but it was not known exactly how such a thing could occur.

In the 1900s, humanity began studying the passage of seismic waves, produced by major earthquakes, through the interior of the Earth. In some regions, these waves were slowing down. This indicated the presence of liquid or partially molten regions beneath the surface. From the 1930s onward, it became understood that molten rock existed in some parts of the mantle.

Between 1960 and 2000, science had developed more advanced and sensitive seismic instruments. Researchers discovered enormous masses of molten rock beneath ocean floors, beneath volcanic regions, and in the deeper layers of the mantle. These were not literally seas of water, but seas of hot molten rock, with temperatures ranging from 1,000 to 4,000°C.

In 2014, which is very close to the present day, researchers in the United States obtained evidence showing that the mineral called ringwoodite, located at a depth of approximately 660 km within the mantle, contains a large amount of water. This study

revealed that the Earth's interior contains an amount of water greater than the total amount of water in the surface oceans.

The first people who heard these verses at that time, of course, did not know that there were literally fires beneath the oceans or that magma existed beneath the Earth's crust and could emerge from it. Yet today, we can see all of these with our own eyes. (Underwater volcanic eruptions)

THE MIRACLE OF THE MOON REFLECTING LIGHT

There are three words used in the Qur'an that carry meanings related to light and illumination:

Sirāj, Diyā', and Nūr.

Sirāj means a lamp, torch, lantern, or source of light. It particularly refers to an object that produces and emits light from within itself, such as a lamp burning with fire. In the Qur'an, the term sirāj is used for the Sun. For example, in Surah An-Naba, verse 13, the Sun is described as "sirājan wahhājan" (a blazing lamp). Likewise, in Surah Al-Furqan, verse 61, it is stated that a sirāj (the Sun) was created in the sky. In usages where this word is emphasized in terms of its quality, the focus is particularly on the source of light.

Diyā' means intense, powerful, self-originating light. It is used in the Qur'an for the Sun. In Surah Yunus, verse 5, it is used in the expression, "Huwa-lladhī ja'ala ash-shamsa diyā'an" (He is the One Who made the Sun a light [source / radiance]). In terms of its quality, it refers to light produced directly from its own source, carrying the characteristics of heat and burning intensity.

Nūr means light and illumination. It has a more abstract character and expresses the general concept of an illuminating effect whose source may be unspecified or divine. In the Qur'an, the term nūr is used for the Moon (Surah Nuh, verse 16; Al-Furqan, verse 61, where the Moon is mentioned as nūran). It is also used in

Surah Yunus, verse 5, in the expression “wal-qamara nūran” (...and [He] made the Moon a light [illumination]). In terms of its quality, it carries the meaning of reflected or radiated illumination.

When we roughly investigate the history of reflection upon the lights of the Sun and the Moon, we can trace such ideas back to the Ancient Greek period, around the 5th century BC. However, an important distinction must be made here. The ideas of the Ancient Greeks were forms of logical reasoning, not proof.

The first evidence that can be regarded as a definite observation is based on Galileo’s observation of earthshine around 1609.

Using a telescope, Galileo noticed that during the crescent Moon phase, the portion of the Moon that remained in darkness appeared to be faintly illuminated. He explained this by stating that the Earth reflects sunlight, and this reflected light illuminates the dark portion of the Moon. This observation constituted the first concrete physical, observational evidence showing that neither the Moon nor the Earth is itself a source of light, but rather that they reflect light. From this point onward, the argument was no longer merely a matter of logical reasoning, but one based directly on observation.

The truly indisputable evidence came after the 1860s, when it was demonstrated that the spectrum of moonlight was identical to that of sunlight. The same Fraunhofer absorption lines were also found in moonlight. If the Moon produced its own light, it would be expected to have a spectrum of its own. The fact that the spectra were identical established, on a physical and evidence-based basis, that moonlight is directly reflected sunlight.

The Qur'an, however, had already pointed to this distinction 1,200 years earlier, without any hesitation, by specifically using the words Sirāj, Diyā', and Nūr in reference to the Sun and the Moon.

THE MIRACLE OF THE ROTTEN HOUSE OF THE SPIDER

“The example of those who take protectors besides Allah is like that of the spider. It builds a house, but indeed, the frailest of houses is certainly the house of the spider, if only they knew!” (Surah Al-‘Ankabut, 41)

When a person reads this verse, the first thing that naturally comes to mind is the physical weakness of a spider’s dwelling. Compared with the homes of other living creatures, a spider’s web is indeed so fragile that it can even be destroyed by a single drop of water.

Here, however, I would like us to think a little more deeply. Allah calls the spider’s house “rotten” and uses this as a description of those who take protectors besides Allah.

Why did Allah express a sociological phenomenon through an example belonging to the field of structural engineering?

The verse ends with the words, “if only they knew!” This means that this rottenness is such a kind of rottenness that people do not know about. Therefore, it cannot be a kind of rottenness that these people already know. This means that Allah is not merely speaking to people about “the weakness of the spider’s web.”

So, if “the rotten house of the spider” is not referring to the spider’s web, then what is it referring to?

Sexual cannibalism, in which the female eats the male, was first mentioned by Charles Darwin in 1871 in his book *The Descent of Man*, where he noted that Blackwall and De Geer had recorded a female spider eating the male. De Geer is described as having been horrified by the sight.

Modern scientific studies became more intensive from the second half of the 20th century onward. Mark A. Elgar's comprehensive review in 1992 was an important milestone. In species such as the Australian redback spider (*Latrodectus hasselti*), the male's "self-sacrificing" behavior (somersault) was examined in detail during the 1990s.

The earliest records concerning matrophagy, meaning the young eating their mother, were reported around 1939 by Kataoka in the Japanese spider *Cheiracanthium japonicum*.

In the 1970s, the German arachnologist Ernst Kullmann described regurgitation feeding and matrophagy in *Stegodyphus* species in detail.

After studies such as Seibt & Wickler (1987) and Kim & Horel (1998, *Amaurobius ferox*) clarified the process, the tissue and histological mechanisms, namely how the mother's body is "prepared," were elucidated through studies by Salomon and colleagues, particularly concerning *Stegodyphus lineatus*. New reports in new species, such as *Stegodyphus pacificus* in 2020, are still emerging.

We see that these investigations began in the 1870s and are still continuing today. We still have not fully uncovered the behavior of spiders.

Research shows us that the spider's house is not only physically rotten, but sociologically rotten as well.

The female spider may kill and eat the male before, during, or immediately after mating. In some cases, however, the male may manage to escape. After the eggs hatch, the mother first provides nourishment through regurgitation. Her tissues then begin to deteriorate, and afterward, the young pierce the mother, who is still alive, and suck out her bodily fluids, generally one to two weeks after hatching. Eventually, only the mother's exoskeleton remains.

Once the food source is exhausted, the young leave the nest. This process generally takes place gradually. After completely leaving the nest, they begin an independent life. They begin constructing their own webs or hunting for themselves. In solitary species, each one sets off on its own path. In social species, such as some *Stegodyphus* species, they may remain together as a group for some time, but they generally disperse eventually.

1300 years ago, no one knew about this sociological rottenness of the spider, yet Allah informed humanity of it through the Qur'an. Moreover, He illustrated it with such a beautiful example that if a person takes someone other than Allah as a friend, that friend will either use him for his own benefit, consume him, or drive him from his place and home.

A person may sometimes endure such great hardships that he may feed that friend with his own hands. He may help that friend, just as the mother spider enables her young to pass from one state into another after emerging from the eggs. He may become everything to those friends, just as a mother is everything to her

offspring. Yet in the end, he may be consumed by the very people he regarded as his friends.

Eventually, just as the spider's nest falls apart, those friendships too are destined to fall apart sooner or later, and the condition of those who take friends other than Allah continues in this way.

Now, when we look at the verse from this perspective, have we understood better, dear reader, that a person should have no true friend other than Allah, and that all the friendships he establishes and relies upon apart from Allah are destined to fall apart like the spider's house?

How many times have you sacrificed yourself for others until now?

How many times have the mountains you trusted been covered with snow?

How many more times must you be betrayed before you understand that your only true Friend is Allah?

Death may come at any moment. If you persist in refusing to turn toward your Lord, the relationships that did not make you happy in this world will certainly not make you happy in the Hereafter.

Although we have been speaking here through the friendships people establish with one another, the relationships through which a person attaches himself to and relies upon money, power, status, social circles, family, children, and others also fall

precisely within the scope of this subject. None of these friends will be able to help you in the Hereafter.

“On that Day, no friend will be of any benefit to another friend, nor will they be helped.” (Surah Ad-Dukhan, 41)

SubhanAllah!!

THE MIRACLE OF THE GOURD PLANT

There is a direct connection between the gourd plant (or Yaqtīn/gourd family) and the treatment of burns, both in traditional medicine and in religious narratives. This effect is not so much due to its being a modern “burn ointment” as it is to its protective, cooling, and moisturizing properties, which support the skin’s natural regeneration.

Plants belonging to the gourd family are beneficial for burn wounds because they help lower the temperature of the tissue and cool it, functioning almost like a natural compress. The leaves and flesh of the gourd plant contain a high amount of water and moisture. In the case of a burn, the most critical first-aid step is to lower the temperature of the affected area. In traditional medicine, crushing gourd leaves and placing them over the wound cools the area, much like a hydrogel dressing, and helps relieve pain.

The leaves and fruit extracts of plants belonging to the gourd family contain natural antioxidants and compounds that promote skin healing. They have anti-inflammatory and cell-regenerating effects. These compounds help reduce redness, swelling (edema), and inflammation that occur in the skin after a burn.

The plant hormone Gibberellin, which enables gourds to grow very rapidly, and the compounds known as Cucurbitacins, which constitute a bitter-smelling defense mechanism that keeps insects and pests away, were isolated by the scientific world in the

middle of the 20th century. It was scientifically demonstrated between 1920 and 1935 why these chemicals repel flies.

It was conclusively established through pharmacological tests conducted after the year 2000 that the aqueous-alcoholic extracts of the leaves and fruits of gourds and related species, particularly against bacteria such as *Staphylococcus aureus*, possess strong antimicrobial and anti-inflammatory protective properties, and that, due to their high zinc and beta-carotene content, they repair the skin barrier at remarkable speed.

“And We caused a gourd-like plant to grow over him.”
(Surah As-Saffat, 146)

Surah As-Saffat, verse 146, states that after Prophet Yunus (peace be upon him) was cast onto the shore from the belly of the fish, a gourd-like plant was caused to grow over him. This plant is the Yaqṭīn plant.

The Yaqṭīn plant, which belongs to the gourd family, has an extraordinary rate of growth. After its seed is planted in the soil, it grows rapidly, branching out without waiting for months, and forms a shelter within a very short period of time when needed. It has extremely broad, dense, and abundant foliage. The air beneath its leaves is always relatively cool, gentle, and humid. Due to the structure of its leaves and the natural scent it releases, pests such as flies and mosquitoes do not approach the plant. In addition to all these protective properties, its fruits, whether they are gourds, melons, or, as some botanists have suggested, the African-origin horned melon (kiwano), have a structure that both relieves thirst and provides satiety. These fruits can also be consumed raw with

ease, and with their soft structure, which is extremely easy to digest and gentle on the stomach, they constitute a highly nutritious food.

This miraculous plant provided shade for the skin of Prophet Yunus (peace be upon him), whose skin had become unprotected, irritated, and sensitive due to the acids inside the belly of the fish. It also kept insects away from his skin, provided relief through the humid air beneath its leaves, and, with its nourishing and burn-specific healing and healing-supporting properties, enabled the unprotected skin, exposed to the barren shore and scorching sun, to regenerate its cells rapidly.

Where could a human being, especially, have known about this plant, which grows at an extraordinarily rapid rate and possesses such specialized properties against burns? The Qur'an has demonstrated an evident miracle in this verse as well.

THE MIRACLE OF OLIVE OIL

In 1833, for the first time, Scottish physicist David Brewster, while conducting experiments on light, observed that when white light was directed onto green plant extracts (chlorophyll solutions), a bright red light was reflected backward.

In 1852, the English mathematician and physicist Sir George Gabriel Stokes precisely described the physics behind this phenomenon. He gave the name “Fluorescence” to the phenomenon in which substances absorb invisible ultraviolet (UV) light and emit light in the visible spectrum.

Humanity discovered this phenomenon 1,200 years later, while the Qur'an had already pointed to this reality.

“Allah is the Light of the heavens and the earth. The parable of His Light is that of a niche in which there is a lamp; the lamp is in a glass, and the glass is as though it were a shining star. It is lit from a blessed tree, an olive tree, neither of the east nor of the west, whose oil would almost give light even though no fire has touched it. Light upon light. Allah guides whoever He wills to His Light. Allah sets forth examples for mankind, and Allah has full knowledge of all things.” (Surah An-Nur, 35)

All of these miracles were written down 1,300 years before their discovery by a man who could neither read nor write. Is not such overwhelming evidence too much even for a mind that insists on refusing to believe?

THE STYLOMETRIC DIFFERENCE BETWEEN THE QUR'AN AND THE HADITHS

The discipline that examines the linguistic style, literary manner, and writing characteristics of an author by using statistical and scientific methods is called stylometry.

Studies conducted using stylometry have found that there is an astonishing stylistic gulf between the Qur'an and the Hadith. This finding is not merely the result of an ordinary study. Stylometric and computational-linguistic comparisons between the Qur'anic and Hadith corpora (the complete body of written works and documents within a particular subject area) are based on comprehensive studies carried out particularly through Authorship Discrimination and Data Mining algorithms.

We see that the best-known studies in this field were conducted primarily by Algerian academic Halim Sayoud and his team, as well as by various data scientists and philologists.

This research, presented in 2012 in Dr. Halim Sayoud's paper entitled "Author Discrimination between the Holy Quran and Prophet's Hadith," was further supported in studies conducted by S. Al-Falahi and his team in 2017, in which the stylometric boundaries between the Qur'an, Hadith, and classical Arabic literary works were verified using larger datasets through n-gram and function-word analyses.

Halim Sayoud's study entitled "Stylometric Comparison between the Quran and Hadith based on Successive Function

Words” was published in June 2022, and in this publication, the dramatic difference between the Qur’an and Hadith in patterns of successive particles and conjunctions was expressed through statistical data.

When we examine the studies, we see that statistical word analysis reveals a significant vocabulary divergence between the Qur’anic text and the major Hadith collections, particularly Sahih al-Bukhari, or sayings directly attributed to the Prophet Muhammad (PBUH).

The studies report that approximately 62% of the words used in the Hadith corpus do not occur anywhere in the Qur’an, while 83% of the words in the Qur’an do not occur in the Hadith texts examined. At the same time, when texts are produced within the same period and by the same person, a natural overlap in an individual’s personal vocabulary (lexicon) would normally be expected. Here, however, we see two distinct linguistic worlds.

Human authors unconsciously use conjunctions, prepositions, pronouns, and other function words in relatively stable patterns, creating what may be described as a linguistic fingerprint. When researchers examined the frequency of paired/sequential function words in Arabic, such as the distribution of structures like *wa-idh*, *min qabli*, *fa-lammā*, they found a major statistical gap between the Qur’anic and Hadith texts. It was determined that the frequency and complexity of such functional structures in the Qur’an are statistically significantly higher compared with the Hadith texts.

When machine-learning classifiers and stylometric algorithms, including Canberra distance, cosine similarity, and

Naïve Bayes, were applied to both texts, it was observed that the algorithms classified the Qur'an and Hadith texts as two separate and independent clusters belonging to two different sources/authors, with an accuracy of over 99%. The two texts do not overlap in computational models with regard to word-length distributions, preferences for singular and plural structures, and patterns of particles.

This sharp stylistic difference between the texts has established that the Hadiths represent human speech, whereas the Qur'an possesses an entirely different structural level.

Since the texts have scientifically been proven to possess completely different linguistic “fingerprints,” humanity must accept that the Prophet Muhammad (PBUH) was not the actual author or source of the Qur'an.

THE MIRACLE OF TAYAMMUM

In 2015, a study published in *Nature*, one of the world's most prestigious and selective scientific academic journals, demonstrated that beneficial bacteria living on the skin train the immune system. Although this study was not directly related to soil, it provided a strong foundation at the time for the understanding that environmental microorganisms could play an important role in human immunity.

In 2018–2019, Finnish researchers began investigating how short-term contact with soil and plant material affected the diversity of bacteria on human skin. In the experiment, volunteers rubbed their hands on various soil- and plant-based materials. Skin samples were taken before and after contact. Following contact with soil, an increase in microbial diversity on the skin was observed. In particular, enrichment was observed in many bacterial groups associated with the immune system. The researchers demonstrated that contact with the natural environment could rapidly alter the human microbiome.

The same research group also examined the effects of soil contact in mice. It was observed that the gut microbiota of mice exposed to soil changed. There was also an increase in immune tolerance markers such as IL-10 and FoxP3, which regulate the immune system. In addition, the severity of allergic reactions decreased.

Finally, in 2022, Internal Medicine Specialist Dr. Abdülkadir Geylani Şahan conducted an interesting study based on

the mention of tayammum in the Qur'an, specifically in Surah al-Ma'idah. In the experiment, people were taken into toilets for six months, and cultures were taken from their hands. After the cultures were collected, the same individuals were instructed to perform tayammum, and cultures were taken again. It was discovered that, after performing tayammum, there was no bacterial growth in the culture samples taken from their hands and that the samples remained sterile, and the findings were immediately presented at international congresses.

Humanity only discovered this fact in 2022, whereas the Qur'an had informed us of it 1,400 years ago.

“O you who believe! Do not approach the prayer while you are intoxicated until you know what you are saying, nor while you are in a state of janabah, except when you are travelling, until you have bathed. And if you are ill or on a journey, or any of you comes from relieving himself, or you have had intimate relations with women and cannot find water, then turn to clean earth and wipe your faces and hands with it (perform tayammum). Surely Allah is Ever-Pardoning, Most Forgiving.”(Surah an-Nisa, 4:43)

“O you who believe! When you rise for prayer, wash your faces and your hands up to the elbows, wipe your heads, and wash your feet up to the ankles. If you are in a state of janabah, then purify yourselves thoroughly. But if you are ill, on a journey, or have come from relieving yourselves, or have had intimate relations with women and cannot find water, then turn to clean earth and wipe your faces and hands with it (perform tayammum). Allah does not intend to impose any hardship upon you, but He intends to purify you and complete His favor upon you so that you may be grateful.”(Surah al-Ma'idah, 5:6)

THE GEODYNAMO MIRACLE

Around the Earth, there is an enormous magnetic protective shield that we cannot see with the naked eye, known as the magnetosphere. The source of the magnetic field that creates this shield is the geodynamo mechanism operating thousands of kilometres beneath the surface of our planet.

People had long wondered why the needle of a compass always points north. In 1600, the English scientist William Gilbert proposed that the Earth behaves like a giant magnet. However, he had no idea how the Earth's magnetic field was produced.

In 1831, Michael Faraday discovered that moving electrical conductors could generate electric currents. This discovery represented a major step toward understanding how the Earth's magnetic field could be generated.

Further research, including studies of seismic waves, revealed the existence of a liquid outer core deep within the Earth, composed primarily of molten iron and nickel. Scientists realized that this moving electrically conductive fluid could act like a giant generator. In 1919, Joseph Larmor mathematically demonstrated for the first time that such a mechanism could generate magnetic fields in celestial bodies.

According to the model accepted today, the liquid iron in the Earth's outer core is in constant motion. Heat coming from within drives this movement, while the Earth's rotation organizes the flows. The moving electrically conductive fluid generates

electric currents, and these currents in turn produce a magnetic field. The magnetic field that is produced supports new currents, allowing the system to sustain itself. This is known as the geodynamo.

The resulting magnetic field extends far beyond the Earth and forms the magnetosphere. This invisible shield deflects a significant portion of the charged particles continuously emitted by the Sun, protecting the Earth and its atmosphere from the effects of the solar wind. The same magnetic system also plays a role in the formation of the auroras.

“And We made the sky a protected ceiling, yet they turn away from its signs.”

(Surah Al-Anbiya, 32)

If solar winds and high-energy charged particles were to reach the Earth's surface directly, they could strip away the

atmosphere and bring an end to all life. The magnetosphere functions precisely as an invisible “protective shield” surrounding the planet, as indicated in the verse.

The discovery that the atmosphere, another protective layer, also has protective properties was only established scientifically much later. Beginning in the second half of the 19th century, scientists began to understand that the atmosphere protects the Earth from solar radiation, and this was demonstrated experimentally, particularly with the discovery of atmospheric ozone in 1913.

The truths that humanity discovered in 1919 were stated in the Qur’an 1,300 years earlier. These truths, which could not have been known with the technology available at that time, could not have been written by a human being. We are not merely speaking of something being unlikely here; we are speaking of a physical and scientific impossibility.

Every reality indicated in the Qur’an is expressed in a clear, definite, and unequivocal manner. It does not use vague statements that could be interpreted in every possible direction.

“We made the sky a protected ceiling.”

It speaks with certainty. It is certain of what it states. It leaves no room for objection or doubt. It is inconceivable that a human being who could not possibly have possessed definite knowledge of this subject at that time would take such a risk and jeopardize such a great claim.

It is not reasonable to evaluate the Qur'an as though its statements were written according to a "maybe it will turn out to be true" mentality. There are many definitive proofs like this in the Qur'an. If we approach them with a "maybe it will turn out to be true" mentality, information that should statistically have had a 50% chance of being wrong would also be expected to contain errors. Yet all of these statements are being scientifically confirmed today.

There is not a single false piece of information in the Qur'an. Not even one. There is not a single example where we can say, "Look, it says this here, but reality is actually different."

Do not fear the truth. Do not fear death. Do not turn away out of fear of obeying the One who created you, O reader.

THE MIRACLE OF CHLOROPHYLL AND THE QUANTUM EFFICIENCY OF SYNTHESIS

The process of photosynthesis in plants converts sunlight into chemical energy with an efficiency approaching 100%. Biophysical research has revealed that plants use the principle of “quantum superposition” to transmit light particles (photons) along the most ideal pathways within the cell.

This microscopic-scale quantum engineering, which human technology has not yet been able to fully reproduce, is not a capability that nature could have invented by itself.

In 2007, a scientific team led by Graham Fleming at the University of California, Berkeley, developed a method called two-dimensional electronic spectroscopy (2D Electronic Spectroscopy), using extremely rapid laser pulses.

Laser flashes on the femtosecond scale (10^{-15} seconds) were directed at the light-harvesting complexes (FMO complexes) of green sulfur bacteria.

During energy transfer, a phenomenon specific to quantum systems, described as a “wave-like beating” or interference (quantum beating/coherence), was detected.

It was discovered that the exciton (a packet of energy) excited by the photon did not follow a single classical pathway as it moved toward the reaction center. Instead, it passed through

several possible pathways simultaneously (superposition), effectively “calculating” and proceeding along the fastest pathway with the least energy loss.

The phenomenon referred to here as quantum efficiency means that nearly every photon absorbed by a plant contributes to the transfer of an electron to the reaction center. In other words, the proportion of photons lost along the way is nearly 0%. This perfection in energy transfer is attributed to quantum superposition.

To put it more simply, for readers who want the idea to be easier to grasp, we can say that the plant wastes virtually none of the sunlight it absorbs; it uses essentially all of that light with an extraordinarily precise mechanism.

The conversion of all incoming light into chemical bonds (sugar), however, is around 3% to 6%, because the plant absorbs only certain wavelengths of incoming light, while the rest is dispersed as heat or thermal radiation.

In quantum physics, states such as “superposition” and “quantum coherence” are extremely delicate. When quantum computers are operated in laboratory environments, the systems are often cooled to temperatures close to absolute zero (-273 °C) and placed under vacuum so that these states are not disrupted.

Plants and bacteria, however, carry out this quantum process at room temperature, in a watery, complex, and “noisy” biological environment, with extraordinary efficiency.

Biophysicists have discovered that the structure of the proteins provides a special “vibrational shield” that helps preserve the quantum state.

The studies I have described here are based directly on thousands of peer-reviewed studies published in journals such as *Nature*, *Science*, and *PNAS*. Scientists today are attempting to imitate this biological mechanism in order to develop more efficient artificial solar panels and quantum sensors. Yet even at the current stage reached by humanity and science, no system has been constructed that is even remotely as efficient as a simple blade of grass.

We have not even managed to be as efficient as a blade of grass yet.

This miracle appears to point us toward a Possessor of infinite knowledge and power. How?

Let me explain, dear reader...

In science, probabilities are expressed between 0 and 1.

When the probability of a highly complex and highly specific system arising spontaneously through random processes is calculated in mathematical biology, such as the remarkable quantum coherence mechanism involved in photosynthesis, the resulting figures approach the limits of impossibility.

It is theoretically possible for heads to come up 100 times in a row when flipping a coin. However, in practice, one would look for an explanation other than a fair coin, such as a manipulated coin. The degree of precision identified by scientists, such as ratios of 1 in 10^{120} in discussions of fine-tuning in the universe, logically rules out the hypothesis of chance. This applies not only to this miracle, but to almost all miracles.

The scientific world accepts that DNA and protein interactions are not merely chemical reactions, but also contain directly encoded information.

According to the principles of Communication Theory (Shannon Information Theory), no coding system, algorithm, language, or software can arise spontaneously without a conscious

intelligence (designer). Just as computer code cannot plausibly emerge through random keystrokes, the algorithm operating at the quantum level within the cell cannot have been “written” by matter itself.

Maintaining quantum states in physics laboratories is extremely difficult. Environmental effects (heat, motion, and so forth) can cause a quantum system to lose its coherence within extremely short periods of time.

Yet the quantum state that humanity can achieve only in laboratories using enormous vacuum and cooling systems, and which it often cannot even maintain there, is achieved within nature’s most crude, noisy, and disordered environments, namely within the watery structure of a living cell. For unconscious atoms to somehow decide for themselves and develop a “vibrational shield” capable of accomplishing this is beyond the capabilities of blind material processes. In other words, even if all rational and knowledgeable scientists came together, they still have not succeeded in creating such quantum environments. How, then, could mindless matter create them?

It is impossible.

Lifeless matter and the systems we call laws of nature do not possess the ability to “plan for the future,” “foresee what lies ahead,” or “develop means toward an intended end.”

Yet we see that the quantum mechanism in photosynthesis appears to deliver the photon to the reaction center through an optimal pathway.

Where there is a purpose, there is a goal.

For unconscious molecules to establish a system while taking into account a future goal cannot be attributed to those molecules themselves; it must, and can only, be the design of a higher intelligence that established that system.

O reader! Please open your eyes. We are obliged to recognize this truth. Those who close their eyes to these truths may, when the time comes, find themselves pleading, “My Lord, please send me back. This time, I will not close my eyes or ears to the truth.”

“Say: ‘I do not tell you that the treasures of Allah are with me, nor do I know the unseen, nor do I tell you that I am an angel. I only follow what is revealed to me.’ Say: ‘Are the blind and the seeing equal? Will you not then reflect?’” (Surah Al-An‘am, 50)

THE MIRACLE OF BIOLOGICAL INTEGRITY

From molecular-scale biological software (DNA) to planetary-scale biochemical cycles (the carbon-oxygen cycle), the fact that all of nature operates synchronously and in an integrated manner, and that the parts of the universe have no meaningful function on their own but acquire function only when brought together within a vast “whole,” points to a single Creator who governs all systems.

In nature, microscopic components (DNA, proteins, enzymes) and macroscopic phenomena (pollen, plant behavior, climate cycles) are not independent; they are interlocked with one another like the components of the same gear system:

DNA → Protein/Enzyme: The sequence in DNA determines the structure of the enzyme.

Enzyme → Plant Biochemistry: Enzymes enable the plant to produce nectar and pollen.

Pollen → Animal Behavior: The chemical composition of pollen activates the olfactory receptors of bees/insects and guides them.

Animal Behavior → Ecological Cycle: The pollination activity of bees ensures the continuity of plant life, while plant life maintains the balance of oxygen and carbon dioxide in the atmosphere.

If even one link in this chain, such as the folding structure of an enzyme or the olfactory receptor of a bee, were missing or defective, the entire ecological chain would collapse. It is impossible for lifeless atoms (carbon, hydrogen, nitrogen) that cannot communicate with one another to evolve independently and, by chance, happen to come together at exactly the point necessary to complete the global cycle. This requires a single Will that sees and designs the whole.

All living beings on Earth, from the simplest bacterium to a blue whale or an oak tree, use the same genetic alphabet (Adenine, Thymine, Guanine, Cytosine). In addition, the energy currency of cells (ATP) and the mechanisms of protein synthesis (ribosomes) are universal.

In information technology systems, different devices need a common “operating system” or protocol (such as TCP/IP) in order to exchange data with one another. The fact that all living organisms in the biosphere speak the same molecular “software language” is evidence that their resources originate from a single “Programmer” and are governed by a single “Authority.” If there were multiple independent creative powers, we would expect to see inconsistent and incompatible operating systems in biological systems.

The relationship between flowering plants and pollinators (bees, hummingbirds, bats) is one of the most concrete examples of the concept of “simultaneous compatibility.”

An orchid species, *Angraecum sesquipedale*, stores its nectar at the bottom of a tube 30 cm deep. The only creature capable

of pollinating it is the moth *Xanthopan morgani*, which has a 30 cm-long proboscis capable of reaching precisely that depth. While the flower has adjusted the chemistry and depth of its nectar, the moth has shaped its mouth structure and flight behavior in accordance with the flower.

The flower belongs to the plant kingdom, while the moth belongs to the animal kingdom. The organ-level perfect correspondence between two separate biological kingdoms, unaware of one another, demonstrates the existence of a single Divine control that simultaneously governs both kingdoms and knows the anatomy and needs of both.

In nature, there are species that are completely dependent upon one another for survival. For example, syconium fig trees can only be pollinated by fig wasps belonging to the family Agaonidae, while the wasps can reproduce only inside these figs. The organs and life cycles of these two living species are perfectly compatible with one another.

Does the simultaneous emergence of two separate living beings, unaware of one another yet compatible with each other, not point to a Creator who created both at the same time and established a connection between them?

The relationship between the fig and the fig wasp is indeed one of the most remarkable examples of symbiosis in biology (the condition in which two different living species live in close contact with one another for an extended period or throughout their lives).

The female fig wasp enters the flowers inside the fig. While laying her eggs, she also carries pollen. The fig produces seeds. The wasp, in turn, raises its next generation.

Ecological cycles (the nitrogen, carbon, water, and phosphorus cycles) operate not only through the behavior of living organisms, but also through chemical reactions carried out by

microorganisms on a global scale. Rhizobium bacteria in the soil fix free nitrogen from the atmosphere, converting it into forms that plants can assimilate. Plants use this nitrogen in protein synthesis. Animals consume these proteins; when they die, decomposing enzymes return the nitrogen to the soil and atmosphere.

A reaction taking place in the metabolism of a microscopic bacterium directly affects the global climate and the nutritional requirements of all living beings. The fact that the microscopic world and the macroscopic world form such a perfectly balanced ecological system can be explained by a single power that controls both realms simultaneously.

According to systems theory (the discipline that examines events and problems not as separate parts but as components of an interconnected whole), individual molecules (DNA, enzymes) have neither the ability nor the “consciousness” to aim at a global ecology on their own.

An enzyme at the molecular level does not care about the oxygen concentration in the atmosphere. A grain of pollen cannot plan the food chain of the entire world. Yet when these components come together, a tremendous “Systemic Teleology” (the condition in which the parts of a system, rather than possessing independent purposes, work together so that the whole can survive, remain balanced (homeostasis), and reach a particular ultimate end) emerges on a planetary scale, keeping itself regulated, repairing itself, and sustaining life.

This “global purpose and consciousness,” which is present in none of the individual parts, cannot arise from the parts of the system. This collective intelligence in nature proves the existence

of the Creator, Allah, who brings these parts together according to a purpose.

From the digital code in DNA to the transportation of pollen by wind and bees; from the functioning of enzymes within cells to the climate cycles of the planet, every detail is a part of a single scenario and a single architecture.

If there were multiple wills governing this system, or if the processes were left to randomness, synchronization between the parts would break down and the system would descend into chaos.

“Had there been gods other than Allah in the heavens and the earth, both of them would surely have fallen into ruin. Exalted is Allah, the Lord of the Throne, far above what they attribute to Him.” (Surah Al-Anbiya, 22)

THE MIRACLE OF THE ROLE OF WIND IN POLLINATING PLANTS AND FORMING RAIN

The German botanist Rudolf Jakob Camerarius, in his work published in 1694, was the first to demonstrate that plants have male and female reproductive organs and that pollen is necessary for reproduction. Later, experiments conducted in the 18th century experimentally confirmed that pollen is carried by the wind, that when pollen released from male flowers reaches female flowers, seeds are formed, and that the wind acts as an active carrier in this process.

The discovery of the role of wind in the onset of rain is much more recent. Studies on cloud physics began in the late 19th century. In the 1930s, Swedish meteorologist Tor Bergeron developed theories explaining how droplets and ice crystals grow within clouds. Between the 1940s and 1960s, measurements were carried out by flying aircraft into clouds, and scientists discovered for the first time that winds lift dust particles from the seas; that they carry dust and aerosol particles into the atmosphere; that water vapor condenses on these particles; that small droplets form; that turbulence and air currents increase the collision of these droplets; and that the droplets grow and eventually fall as rain.

This discovery showed that winds do not merely carry clouds, but also carry the raw materials necessary for the precipitation process.

Humanity began studying this phenomenon in 1694 and only discovered it in the 1940s, whereas the Qur'an informed humanity of this fact 1,100 years earlier.

“And We sent the winds fertilizing, and We sent down water from the sky and gave it to you to drink. And you are not the ones who store it.”(Surah Al-Hijr, 22)

THE MIRACLE OF FINGERPRINTS

The fact that fingerprints are different in every human being, and that this difference can be used for identification, emerged through the combined work of several scientists over the course of approximately the 19th century.

The first detailed scientific classification of the ridges on the fingers was made in 1823 by the Czech physiologist Jan Evangelista Purkyně. Purkyně demonstrated that the ridges on the fingertips form different geometric patterns and divided them into nine basic types. However, at that time, it had not yet been established that these ridges could be used to identify individuals.

The real turning point came in 1858 with Sir William James Herschel in India. Herschel began using people's fingerprints in contracts and official transactions. His initial purpose was not to make a scientific discovery, but to prevent people from carrying out the same payment or transaction more than once. Over time, however, when he compared the fingerprints of the same individuals years apart, he noticed that the patterns of the finger ridges were remarkably permanent. In a report dated 1877, he argued that fingerprints could be used to verify people's identities.

Henry Faulds later developed the idea of turning fingerprints into a scientific method of identification. While working in Japan in the late 1870s, he began examining fingerprints left by people. He collected fingerprints from different individuals and observed that the small details among them were different. In an article published in *Nature* in 1880, he proposed that fingerprints

could be used for personal identification and that fingerprints left at a crime scene could be used to identify a criminal.

It is important to be aware that saying, "Fingerprints appear to be different," still did not constitute scientific proof of the conclusion that "every person's fingerprint is unique." A much larger number of fingerprints had to be compared for this to be established.

This work was carried out primarily by the English scientist Francis Galton. Beginning in the late 1880s, Galton collected thousands of fingerprints and began examining them statistically. He accumulated more than 8,000 fingerprints in his own collection. He examined not only the general patterns of the finger ridges, but also small details such as ridge endings, bifurcations, and the ways in which ridges intersected with one another. In this way, he demonstrated that what identifies a fingerprint is not merely a general pattern such as a "loop," "arch," or "whorl," but the structure formed collectively by numerous small details.

Galton's book *Finger Prints*, published in 1892, was a historic turning point in this respect. Galton established that fingerprints remain largely unchanged throughout a person's lifetime, differ from one individual to another, and can be systematically classified and used for identification. He also developed one of the first practical classification systems that made it possible to store fingerprints and compare them later.

In 1823, Purkyně classified fingerprint patterns; from 1858 onward, Herschel used them for practical identity verification; in 1880, Faulds explicitly proposed using fingerprints to identify criminals; and in the early 1890s, Galton placed their permanence,

distinguishing characteristics, and usefulness for identification on a scientific foundation through extensive data collection and statistical analysis. The establishment of fingerprint identification in modern forensic science, however, took place mainly during the 1890s and the early 1900s.

1,300 years before this discovery by humanity, the Qur'an pointed to this particular characteristic of the fingertips.

"Yes, We are fully capable of restoring even his fingertips exactly as they were before."
(Surah Al-Qiyamah, 4)

THE MIRACLE OF SURAH AR-RUM

The Byzantine-Sasanian war mentioned in the opening verses of Surah Ar-Rum, together with the developments that followed, is one of the most concrete and historically well-documented examples of the Qur'an's prophecies concerning the future. To understand the details of this event, its historical background, and why it is regarded as a miracle, it is necessary to examine the geographical and political conditions of the period.

A devastating war had begun between the two superpowers of the time, the Eastern Roman (Byzantine) Empire and the Sasanian (Persian) Empire. Taking advantage of the internal turmoil and succession struggles that were consuming the Byzantine Empire, the Sasanian ruler Khosrow II launched a large-scale invasion.

Between 611 and 615, the Sasanians raided Byzantine territories and captured Antioch, Damascus, and Jerusalem, a city of immense spiritual importance to the Christian world. During the fall of Jerusalem, thousands of Christians were massacred, and the "True Cross," regarded as the most sacred relic of Christianity, was taken by the Sasanians to their capital, Ctesiphon. The Sasanian advance did not stop there. In 619, Egypt, the Byzantine Empire's granary and wealthiest province, was also invaded. The Sasanian armies had advanced as far as Chalcedon, directly across from Constantinople.

At that time, the Byzantine Empire was in a state of complete economic, military, and moral collapse. The treasury was

empty, the army had disintegrated, and most of the empire's territories had been lost. The prevailing view among contemporary historians and observers of the period was that the Eastern Roman Empire was on the verge of disappearing from the stage of history. In fact, the Byzantine Emperor Heraclius had even considered moving the capital from Constantinople to Carthage.

It was during this period, when the Sasanians had brought Byzantium to the point of being erased from the map, approximately in 614–615, that Islam was still in its early stages of spreading in Makkah and the Muslims were facing severe persecution. The Sasanians were Magians, while the Byzantines were Ahl al-Kitāb (People of the Book), being Christians. The pagan Meccans felt closer to the Magians, rejoiced at Byzantium's defeat, and exerted psychological pressure on the Muslims by saying, "Your friends, who possess a Book like you, have been defeated, and we will soon destroy you as well." The Muslims, meanwhile, were deeply saddened by the defeat of Byzantium, a people who belonged to a revealed religion.

It was precisely in this atmosphere of despair that the opening verses of Surah Ar-Rum were revealed:

"The Romans have been defeated in a nearby land. But after their defeat, they will be victorious within a few years. Before and after, the command belongs to Allah. And on that day the believers will rejoice in Allah's victory. He gives victory to whom He wills. And He is the Almighty, the Most Merciful."

(Surah Ar-Rum, 2–5)

The expression "bid'i sinīn" mentioned in the verse refers in Arabic to a period of between 3 and 9 years. The expression

"adnā al-arḍ" mentioned in the verse can mean both "the nearest land" and, geographically, "the lowest land." Indeed, the region of the Dead Sea, where the war took place, is the lowest point on the Earth's land surface.

Shortly after the revelation of these verses, a miracle that no one considered likely began to unfold. Emperor Heraclius took revolutionary measures, melted down the gold of the Church, had money re-minted, and reorganized his army from the ground up.

By 622, Heraclius personally set out on an eastern campaign at the head of his army. In 624, the Byzantine army entered the Caucasus and Azerbaijan regions, deep within Sasanian territory, and destroyed Sasanian sacred fire temples. The final confrontation between the two armies took place at the Battle of Nineveh at the end of 627. Byzantium inflicted a decisive defeat on the Sasanian army. The Sasanian Empire was plunged into internal turmoil, Khosrow II was overthrown by his own son, and the Sasanians were forced to seek peace. All the Byzantine territories that had been occupied were recovered, and the True Cross was brought back to Jerusalem.

The Byzantine victory occurred precisely within the period of time specified by the Qur'an, approximately 9 years later. Moreover, as stated in the verse, the Muslims also experienced joy during this very period by achieving the victory at the Battle of Badr, resulting in a double cause for rejoicing.

One of the fundamental reasons why this event is regarded as evidence that the Qur'an is of divine origin and as a miracle is that the verse presented a political and military prediction that appeared impossible at the time. The less likely an event is to occur,

the greater the risk of making a definitive prediction about it years in advance. At a time when Byzantium had collapsed, its army had been destroyed, and the Sasanians were at the height of their power, logic and military strategy indicated that Byzantium would not be able to rise again. It would be impossible for a human mind to tie its own reputation and the future of the religion it had established to such a seemingly impossible claim.

The Qur'an did not merely make an open-ended and vague statement such as, "One day they will be victorious." Rather, it limited the timeframe to between 3 and 9 years by using the expression "bid'i sinīn." If Byzantium had won 15 years later, or had never won at all, the enemies of Islam among the Meccans could have used the Qur'an's statement as a powerful weapon to completely discredit Islam. Indeed, Abu Bakr and one of the polytheists, Ubayy ibn Khalaf, made a wager concerning these verses, and when the appointed time came, Abu Bakr won the wager. Although they had initially agreed to wager ten camels without being completely certain of the outcome, the Prophet (peace and blessings be upon him) told him to make the agreement for 100 camels. When the Qur'an's prophecy came true, Abu Bakr received 100 camels. (It should be noted, for those who attempt to argue that this constitutes a contradiction within Islam by considering it gambling, that gambling and games of chance involve taking a risk in order to gain something when the person does not know the outcome. Here, however, the agreement was made concerning a known event that the Qur'an had explicitly foretold, and therefore it cannot be considered gambling.)

The verse did not merely state that Byzantium would be victorious; it also foretold that the Muslims would rejoice on that day. At the time of Byzantium's victory, the Muslims also achieved

their first major victory against the Meccan polytheists at Badr and rejoiced. This demonstrates that the prophecy was fulfilled in two dimensions, exactly as stated.

Moreover, the fact that the expression "adnā al-arḍ", used in the verse for the location where the war took place, points to a geographical reality that could not have been measured with the knowledge available at the time, namely that the vicinity of the Dead Sea is the lowest point on the Earth's land surface, constitutes another distinct miraculous layer that cannot be denied and that even those who do not believe are intellectually compelled to acknowledge.

THE MIRACLE OF THE EARTH'S GASEOUS STAGE

In its earliest stages, the universe was in the form of a cloud of gas (smoke). Stars and planets were formed as a result of the compression and condensation of gases. In this respect, our Solar System, our Earth, and all the stars we see after darkness falls took shape through a series of stages, including the compression of atoms that were initially in a gaseous state. The fact that the universe was initially in a hot, dense gaseous state was discovered and proven in the mid-20th century, when theory and observation came together.

In the 1940s, physicist George Gamow, together with Ralph Alpher and Robert Herman, proposed that if the universe was expanding, it must have been much smaller, hotter, and denser in the past.

The observational confirmation of the theory occurred by chance in 1964. Arno Penzias and Robert Wilson, American radio astronomers working at Bell Laboratories, detected a continuous and constant “interference/static” that would not disappear no matter which direction they pointed a highly sensitive dish antenna toward while examining radio signals coming from space. At first, they thought that this noise was caused by bird droppings or a malfunction in the equipment, and they cleaned the antenna. However, the interference did not disappear.

When they contacted theoretical physicist Robert Dicke and his team at Princeton University, they realized that what they had

discovered was not noise, but the first light remaining from the gaseous state of the universe that Gamow had referred to, namely the Cosmic Microwave Background Radiation (CMB).

This discovery proved that the universe had initially been an extremely hot mass of gas and earned Penzias and Wilson the 1978 Nobel Prize in Physics.

Between 1989 and 2001, NASA's COBE satellite measured the temperature fluctuations in this mass of gas from the early universe. These fluctuations demonstrated how homogeneous clouds of gas collapsed in certain regions under the influence of gravity, leading to the formation of the first stars and galaxies.

In 2011, astronomers succeeded in directly observing, using the Keck Telescopes, pristine primordial gas clouds that had formed shortly after the Big Bang and had never become stars, consisting entirely of hydrogen and helium.

Humanity only began formulating theories about this phenomenon in the 1940s, was only able to prove it in 1978, and was not able to directly observe it until 2011. Yet the Qur'an foretold this phenomenon 1,300 years ago.

“He placed firm mountains upon the earth, and He bestowed blessings upon it. And He determined and ordered its provisions therein in four days, equally for those who ask.”

(Surah Fussilat, 10)

“Then He turned towards the heaven while it was smoke, and said to it and to the earth: ‘Come, willingly or unwillingly, to My command.’ They both said: ‘We come willingly.’”

(Surah Fussilat, 11)

“Thus He completed them as seven heavens in two days (two stages), and revealed to each heaven its command. And We adorned the lowest heaven with lamps and made it a protection. That is the decree of Allah, the Almighty, the All-Knowing.”

(Surah Fussilat, 12)

THE MIRACLE OF THE EARTH'S ROTATION

In ancient times, the occurrence of night and day was explained by the movement of the sky or the Sun around the Earth. However, in 1543, Nicolaus Copernicus demonstrated that night and day occur as a result of the Earth rotating on its own axis.

In the 17th century, Galileo Galilei and Isaac Newton established the physical laws governing this rotational motion. Because the Earth rotates at a relatively constant rate around its axis, night and day follow one another in a continuous and orderly sequence; one cannot suddenly occupy the time of the other and overtake it. Although, when viewed from Earth, the Sun and the Moon appear to follow similar paths across the sky, the true nature of their motions became clear in the 17th century with Johannes Kepler's and Isaac Newton's discoveries concerning the laws of gravitation and orbital mechanics. According to these discoveries, the Moon revolves in an orbit around the Earth.

The Earth, together with the Moon, revolves in an orbit around the Sun. The Sun, in turn, moves along its orbit around the center of the Milky Way Galaxy. Since each celestial body has a different mass, gravitational force, and orbital radius, it is physically impossible for the Sun and the Moon to collide with one another in their natural courses or to intersect in the same orbit and "catch up" with each other.

The truth that humanity discovered in the 17th century was revealed by the Qur'an in the 7th century.

“The sun cannot overtake the moon, nor can the night outstrip the day. Each is floating in an orbit.”(Surah Ya-Sin, 40)

THE MIRACLE OF THE MOON'S ANALEMMA

If a camera is placed at a fixed point and a photograph is taken once every day for one month, exactly 50 minutes and 29 seconds later each day, because the Moon rises on average this much later in the sky each day, the Moon does not draw a straight line across the sky, but rather a curved or looped path resembling the shape of an “8” or an “S,” known as an analemma. Because the Moon’s orbit around the Earth is not a perfect circle but an ellipse, and because its orbital plane is inclined, the Moon shifts slightly farther north or south, or forward or backward, each day.

Since analemma photography requires advanced technology, it is a relatively recent practice. The first solar analemma was photographed in 1979, while a lunar analemma could only be photographed by astrophotographers in the 21st century, in the 2000s, using complex timing and image-compositing techniques. Modern photography has made this curved loop, the analemma, into a tangible visual by superimposing the individual exposures.

Now, look at the Qur’an’s description, O reader.

How beautifully it points to it.

“And as for the Moon, We have ordained phases for it, until it returns like the old date-palm stalk, curved like a bow.”
(Surah Ya-Sin, 39)

As the pages go by, it continues: we have seen numerous miracles. All of them are scientific, observable miracles, miracles that require not even thinking or reasoning.

After seeing all of this, are you still insisting on refusing to believe?

Then pursuing happiness in this world suits you best. When you stand trembling in terror on the Day of Judgment and say, “I

saw it, I believed. Is there no way now to return and make amends for what I did?”, you will be told: “Only now do you believe?!! While you were in the world, you used to mock. Let those whom you took as gods save you, then! Throw him into Hell forever!!” For that reason, at the very least, may you enjoy yourself a little during the remainder of your life, if Allah permits. Perhaps.

THE MIRACLE OF EVERYTHING BEING CREATED IN PAIRS

Until now, humanity had of course observed that humans and animals were created in pairs. When the Qur'an speaks about creation in pairs, people probably thought first of the pairs of humans and animals, as we would naturally expect.

However, the Qur'an did not limit this subject to them.

“Glory be to Allah, Who created all the pairs, from what the earth produces, from their own kind, and from things they have no knowledge of.”

(Surah Ya-Sin, 36)

It speaks not only of plants, and not only of humans, but of the creation of pairs in many things that human beings themselves would not know.

In the 610s, when the Qur'an was revealed, there were still many forms of creation in pairs that humanity could not possibly have known about. Let us look together at a few of these examples, although a detailed examination would fill entire books.

For example, throughout history, plants were thought to be stationary and sexless. However, in 1694, the German botanist Rudolf Jakob Camerarius experimentally demonstrated for the first time that plants also possess male and female reproductive organs, and that the female organ cannot produce seeds without being fertilized by pollen from the male organ. Then, in 1753, Carl

Linnaeus published his famous classification system, in which he classified plants according to the numbers of their male and female reproductive organs, revealing the sexual duality of the plant kingdom. These discoveries revealed the dual structure of the plant world, ranging from completely separate male and female trees, such as kiwis and date palms, to species that contain both sexes within the same flower.

In the animal kingdom, although the existence of male and female pairs was one of humanity's oldest observations, the biological foundations of this duality were only unraveled with the invention of the microscope in the second half of the 17th century. In 1677, Antonie van Leeuwenhoek discovered sperm, while in 1827, Karl Ernst von Baer succeeded in observing the mammalian egg cell. In 1875, when Oscar Hertwig demonstrated that fertilization occurs through the union of two opposing reproductive cells, sperm and egg, the principle of existence and reproduction in pairs in the animal kingdom could finally be confirmed at the cellular level.

The discovery of dualities at the cellular and genetic levels became apparent in the 1880s, when Walter Flemming and Eduard Strasburger discovered that the chromosomes in the cell nucleus were not arranged randomly, but existed in homologous pairs, one originating from the mother and the other from the father.

One of the greatest examples of creation in pairs in living organisms was revealed in 1953, when James Watson and Francis Crick announced the double-helix structure of DNA and the fact that nucleotide bases, Adenine-Thymine and Guanine-Cytosine, always combine in precisely matching pairs. Thus, it became

understood that even all the codes of life are written in a dual structure.

The discovery of duality at the most fundamental level of matter and the universe was one of the greatest revolutions in 20th-century physics. In 1924, Louis de Broglie demonstrated that matter possesses both particle and wave characteristics, revealing two different aspects of mass through wave-particle duality. In 1928, theoretical physicist Paul Dirac, while solving relativistic quantum equations, predicted the concept of antimatter based on opposite signs in mathematics and proposed that every fundamental particle in nature should have an opposite counterpart with the opposite electric charge. This theory was confirmed experimentally in 1932 when Carl Anderson discovered the positron, the antiparticle of the electron. Physicists discovered that, for matter to be created from pure energy, a particle and its antiparticle must emerge simultaneously, meaning that such production can occur only through “pair production.”

When we look more deeply into the structure of the universe, we witness that the principle of duality is not limited merely to matter or living organisms, but can be seen at every level of existence, from cosmology to the human mind, from digital technology to the passage of time. The universal order proceeds through immense oppositions and dual mechanisms that constantly interact with and balance one another.

On the cosmic scale, the universe proceeds through two opposing forces. On one side stands gravity, which holds matter together and shapes galaxies and stars; on the other stands dark energy, which occupies most of the universe and causes space to expand continuously.

This physical balance is accompanied by the duality of order and disorder in thermodynamics. While the general tendency of the universe is toward continually increasing disorder, or entropy, life, on the contrary, exhibits an opposing dynamic by generating order in localized regions and resisting this dispersal.

Similarly, in electromagnetism, a single magnetic pole can never exist alone; no matter how much a magnet is divided, it always immediately forms two opposing poles, North and South.

In the quantum microcosm, when the state of one of two entangled particles is measured, the other particle, even if they are light-years apart, instantaneously assumes the exact opposite state, revealing an unbreakable dual connection between them.

Even the civilization of knowledge and technology built by humanity has been constructed directly upon this binary structure. The binary system underlying all digital machines, computers, and artificial intelligence today is based simply on the principle of the presence (1) or absence (0) of an electrical current.

The discipline of logic and mathematical proofs also operate according to the rules of binary logic, which state that a proposition can be either true or false.

In physical reality, as understood through Einstein's theory of relativity, space and time are not separate phenomena; rather, they constitute an inseparable spacetime fabric in which they directly affect one another through the curvature caused by mass.

The duality of time as merely flowing from the past toward

the future forms the foundation of cause-and-effect relationships in the universe.

When we turn to the human being's inner world and perception, we encounter the same architecture. The mind-body duality, debated in philosophy for centuries, examines the dual structure between our tangible biological existence and our intangible experience of consciousness.

Even the human brain is anatomically divided into two hemispheres: the left hemisphere, which carries out analytical processes, and the right hemisphere, which governs holistic and visual perception.

In psychology, the mind is divided between the conscious awareness of which we are aware and the unconscious, which shapes much of our behavior.

Even the way human beings perceive their surroundings is built upon opposites; hot gains meaning through cold, light through darkness, and existence is defined and understood only through the boundaries of non-existence.

When all these dualities are examined, it becomes clearly apparent that the opposing poles in the universe do not exist to destroy one another; rather, they necessarily coexist in order to generate movement, establish a system, and preserve existential balance.

I believe there are undoubtedly many more examples of creation in pairs that we have not been able to include here. Yet even these examples are enough to bring the human mind to

surrender before the miracle of the Qur'an concerning the creation of all things in pairs.

If there is still anyone saying, "No, I have not surrendered," the Qur'an itself gives the answer:

"Those are the ones who denied the Book and what We sent with Our messengers. They will soon come to know the truth! When shackles and chains will be around their necks, they will be dragged into boiling water; then they will be burned in the Fire."

(Surah Al-Mu'min, 70, 71, 72)

THE MIRACLE OF THE COMPRESSION OF THE EARTH AND THE REDUCTION OF THE LANDS

The loss of land from coastal boundaries through coastal erosion, erosion, mass wasting, and rising sea levels has been gradually discovered by humanity, both through historical experience and through scientific methods that developed over time.

The clear identification of coastal erosion by humanity through science and technology, however, only became possible in the 18th and 19th centuries with the emergence of modern geology.

James Hutton, one of the pioneers of geology, put forward the principle of “Uniformitarianism,” also known as the principle of actualism, arguing that the processes of wind, waves, and erosion that we observe today also operated in the same manner in the past. Hutton scientifically formulated that rainfall and rivers wear down mountains and carry their material into the sea, while waves continuously erode the land. Subsequently, in his work published in 1830, Charles Lyell demonstrated, using traces of marine organisms on the columns of the Temple of Serapis near Naples as evidence, that lands do not disappear solely through erosion, but can also become submerged due to subsidence or changes in sea level.

In the following years, the connection between this process and global climatic changes and glaciers was uncovered. With Louis Agassiz and the researchers who followed him discovering

the Ice Ages, it became understood that the Earth periodically undergoes cycles of freezing and melting. During the Last Glacial Maximum approximately 20,000 years ago, sea levels were 120–130 meters lower than today, and it was geologically confirmed that, as the glaciers melted, the seas rose and submerged former land bridges such as the English Channel and the Bering Strait. During the same period, physical geographers and engineers began quantitatively measuring wave breaking and coastal currents, demonstrating that steep coasts are undercut by waves from below and then collapse into the sea through landslides and mass wasting.

Today, thanks to satellite and radar technologies that have developed since the 1970s, the process of land loss can be monitored on a millimetric scale. Through satellites such as TOPEX/Poseidon and Sentinel, the annual rate of global sea-level rise is measured with precision, while LiDAR surveys are used to map how many meters sea cliffs retreat inland each year.

The reality that humanity could only discover in the 18th century was revealed by the Qur'an 1,300 years ago.

“Have they not seen that We are gradually reducing the land from its edges? Allah judges. None can reverse His judgment. And He is swift in reckoning.”

(Surah Ar-Ra'd, 41)

THE MIRACLE OF THE PREFRONTAL CORTEX

The discovery that the prefrontal cortex, (the front part of the brain), is responsible for higher-level mental processes such as planning, decision-making, lying, and motivation began with the famous Phineas Gage accident that occurred in the United States in 1848.

Gage, a railroad worker, miraculously survived after a massive iron rod was driven through his skull in an explosion, completely piercing his left prefrontal cortex. Before the accident, Gage was an extremely reliable, organized, polite, and successful person in his work. After recovering from the accident, however, he had completely changed. Although his memory and motor skills remained intact, Gage had become a person who swore, was impatient, could no longer plan for the future, disregarded social rules, and had lost his ability to make decisions. This event became the first direct and concrete evidence in neurology that specific regions of the brain were involved in regulating human personality, moral decision-making, and future planning.

Following the path opened by the Phineas Gage case, neurologists and surgeons in the late 19th and early 20th centuries continued to uncover the secrets of the prefrontal region by studying similar brain injuries and tumor cases. Particularly during the First and Second World Wars, clinical observations of soldiers who had suffered injuries to the prefrontal regions showed that this area was involved not so much in intelligence as in processes known as “executive functions,” such as planning, organization,

and impulse control. The controversial brain surgeries performed during this period, such as lobotomy, demonstrated that patients whose prefrontal cortexes were disconnected from other brain regions could suffer severe deterioration in their emotions, motivation, and decision-making abilities.

Later, with the introduction of computed tomography, Magnetic Resonance Imaging (MRI), and especially functional Magnetic Resonance Imaging (fMRI) into the medical world, this process of discovery reached its scientific peak. Through fMRI, researchers gained the ability to observe, in real time, which areas of the brain receive increased blood flow and become active while a living, healthy person is making a decision, developing a strategy, or lying. Experiments have shown that when a person speaks honestly, the brain expends less energy, whereas when lying, the prefrontal cortex works intensively in order to suppress the truth and construct an alternative scenario. Thus, the observational process that began with Phineas Gage was followed by modern brain-imaging methods, demonstrating the central role of the prefrontal cortex in the higher mental processes that make us human.

Humanity discovered this fact in 1848, yet the Qur'an pointed to it 1,300 years earlier.

“No! If he does not desist from this behavior, We will surely seize him by the forelock (forehead), that sinful, lying forelock (forehead), and drag him into Hell.”

(Surah Al-‘Alaq, 15–16)

O reader, if you have behaviors such as not believing in the existence and oneness of Allah or continuing to commit sins

carelessly and without concern, I advise you to abandon these behaviors immediately. Do not regard the events described here as a fairy tale. I swear that all of them are real.

WAKE UP!!

THE MIRACLE OF THE WEIGHT OF CLOUDS

The fact that a storm cloud (cumulonimbus), which appears as light as cotton, carries hundreds of thousands, or even millions, of tons of water could only be understood in the 20th century through experimental advances in atmospheric physics and mathematical calculations.

This discovery was gradually established by measuring the parameters of “volume” and “water density,” based on the fact that clouds cannot be placed on a scale and weighed.

At the beginning of the 19th century, the English amateur meteorologist Luke Howard laid the foundations of modern meteorology by classifying clouds. However, at that time, scientists were more concerned with how water vapor condensed and remained suspended in the air than with the fact that clouds carried enormous masses. Once it was understood that a cloud consists not merely of water vapor but also of microscopic water droplets, scientists began considering the question: “How much mass does all this water suspended in the air constitute?”

The major breakthrough in calculating the weight of clouds came in the 1940s and 1950s, when research aircraft began flying through clouds. Meteorologists passed through storm clouds in aircraft equipped with special absorbent filters, optical sensors, and laser probes. As a result of these measurements, data known as “Liquid Water Content” (LWC) was obtained. Measurements showed that an ordinary white cumulus cloud contains an average

of 0.5 grams of water per cubic meter. In enormous cumulonimbus clouds that produce storms, this density was found to reach 1 to 3 grams per cubic meter.

Once the amount of water per cubic meter had been determined, the next step was to calculate the total size, or volume, of the cloud. Meteorologists measured the width, length, and height of storm clouds by making use of their shadows or through radar and satellite imagery.

A standard storm cloud (cumulonimbus) can generally reach several kilometers in width and an enormous height of 10–12 kilometers. For example, a cumulonimbus cloud that is 10 km wide, 10 km long, and 10 km high has a volume of 1 trillion cubic meters. If there is an average of 1 gram of water in each cubic meter, this simple multiplication reveals that the cloud contains 1 million tons (1 billion kilograms) of water.

Once this discovery had been established, scientists had to solve a second major question: “How can hundreds of thousands of tons of water fail to fall onto our heads as a single mass?”

The answer was provided by thermodynamics and fluid mechanics. The water in a cloud does not exist as one enormous mass. Rather, it is dispersed in the form of trillions of microscopic droplets, each approximately one-hundredth of a millimeter in diameter. These droplets are so small that air resistance almost neutralizes the effect of gravity on them. In addition, the enormous upward currents of warm air (updrafts) rising beneath storm clouds push these microscopic droplets upward. When the droplets combine and become large enough to gain sufficient weight, they succumb to gravity and fall to the ground as rain.

In summary, humanity first entered clouds with aircraft and measured the amount of water per cubic meter with laboratory precision. It then calculated the enormous volumes of clouds through radar and satellites, thereby proving mathematically and physically that storm clouds can weigh millions of tons.

Yet the Qur'an clearly stated this fact 1,300 years ago, a fact that humanity only discovered in 1940.

“And He is the One Who sends the winds as good news before His mercy. Then, when they carry heavy clouds, We drive them to a lifeless land and send down rain upon it, bringing forth all kinds of fruits. This is how We will bring forth the dead. Perhaps you will be mindful.”

(Surah Al-A'raf, 57)

“He is the One Who shows you lightning, inspiring you with fear and hope, and brings forth the heavy clouds.”

(Surah Ar-Ra'd, 12)

At the end of every miracle, I try not to repeat the same things in order to avoid repetition. However, let us not forget the period in which the Qur'an was revealed, the fact that Prophet Muhammad (peace and blessings be upon him) was an unlettered person, and that it was impossible for such miracles described in the Qur'an to have been known at that time. Therefore, every example we discuss here is, in particular, a miracle proven through science.

For example, as one ascends to higher altitudes, atmospheric pressure and the amount of oxygen decrease. When a

person reaches a certain altitude, they experience a feeling of tightness in the chest and have difficulty breathing due to the lack of oxygen.

The Qur'an also contains a clear verse concerning this matter:

“So whoever Allah wills to guide, He opens their heart to Islam. And whoever He wills to leave astray, He makes their chest tight and constricted as though they were climbing into the sky. This is how Allah leaves those who do not believe in filth.”

(Surah Al-An'am, 125)

In my view, the fact that the Qur'an informed us in 610 that a person's chest becomes constricted and breathing becomes difficult as they ascend is also an obvious miracle. There are many other miracles like this, but I have not included them in this book. This is because such miracles can be confronted with an absurd claim, even if that claim is unsupported and irrational.

In other words, when someone reads this miracle, they might say, “So what? A man climbed Mount Everest, became short of breath, then came back down and told someone about it. That person walked 7,000 km to Mecca and told someone in the marketplace, and Prophet Muhammad (peace and blessings be upon him) happened to hear it and wrote it down.” For this reason, I am not discussing such miracles here.

Is the practical realization of this claim almost impossible?
Yes.

Would it be realistic for someone who climbed a mountain and came back down to run all the way to Mecca, covering a distance of 7,000 km, simply to tell someone in the marketplace about his shortness of breath? No.

Would such a claim be absurd? Yes.

However, the aim of this book is to be an ironclad work that, without even giving rise to such meaningless objections, presents miracles in such a clear manner that minds opposing them have no choice but to acknowledge them scientifically; a work that leaves those minds with their hands tied and their heads pounding from the force of the evidence. By the permission of Allah, I pray that this book may be upon the truth.

Alhamdulillah!

THE MIRACLE OF THE EARS REMAINING ACTIVE DURING SLEEP

The discovery of sensory processing mechanisms during sleep and the brain's ability to preserve sleep by filtering sound signals (sensory gating) took place through a gradual process extending from the development of electroencephalography (EEG) devices to microelectrode recordings and modern brain-imaging technologies.

The development of the ability to monitor brain activity electrically in the 1920s, when Hans Berger invented EEG, was the first step in demonstrating that sleep is not merely a passive state of shutdown. However, understanding to what extent sensory inputs are processed during sleep and that a region of the brain called the thalamus functions like a “gatekeeper” dates back to the 1960s and 1970s. During this period, neurophysiological experiments conducted on animals and humans established that, particularly during the deeper stages of sleep (slow-wave sleep), the sound receptors in the inner parts of the ear and in the brainstem remain active. However, it was discovered that the thalamic reticular nucleus produces inhibitory (GABAergic) signals that prevent these sensory signals from being transmitted to the auditory cortex and higher neuronal networks. This mechanism, known as “Thalamic Gating,” was identified as the principal structure that prevents sound waves coming from the outside world from reaching consciousness and interrupting sleep, even though they physically reach the ear and continue to be processed at the level of the brainstem.

In the 2010s and 2020s, cellular-level electrode recordings and functional brain-imaging techniques (fMRI, MEG) developed this discovery to a much more striking level. Thanks to deep electrodes placed in the brains of patients with epilepsy for medical reasons, researchers found that when sounds were presented to individuals during sleep, the primary auditory cortex continued to produce strong responses to sounds, much as it does during wakefulness. However, during deep sleep, the brain interrupts the “top-down” flow of information and cortical feedback loops (particularly those involving alpha-beta waves), thereby preventing the sound from being analyzed, interpreted, and becoming the focus of attention. Thus, the scientific world has definitively demonstrated that the ear does not “shut down” during sleep and continues to listen at the level of the brainstem; nevertheless, sleep continues uninterrupted because higher-level signal transmission between the thalamus and the cortex is suppressed.

“Then We struck a veil over their ears for many years (shutting them off from the outside world).”

(Surah Al-Kahf, 11)

Contemporary neurological and physiological findings show a complete parallel with this verse of the Qur’an.

In human physiology, there is no organ, like the eyelids, that physically closes the ear from the outside. The eardrum, inner ear, and auditory nerves continue to receive environmental sounds as vibrations even while a person is asleep. In other words, the organ itself continues to function. However, for a person to remain in a deep sleep for extremely long periods of time, such as hundreds of years (in a state resembling coma or suspended animation), the sound signals received by the ear would need not to be transformed

into conscious perception in the brain and would need not to trigger the mechanisms responsible for awakening.

As demonstrated by the discoveries of neurology, the brain does not “close” the ear during sleep; rather, it suppresses strong stimuli coming from the ear at the level of the thalamus and in cortical signal transmission. Thus, the expression in the verse, “We struck a veil over their ears,” points precisely to this neurological suppression mechanism (thalamic gating). The verse describes, in both a literary and scientific harmony, how sounds transmitted by the physiologically open and functioning ear are suppressed by the brain, thereby isolating the Companions of the Cave from auditory stimuli in the outside world and enabling them to remain asleep for a long period without awakening.

The expression “We struck over their ears” (Arabic: *darabnā ‘alā ādhānihim*) describes the functional blocking of the sense of hearing, the prevention of external sounds from affecting the Companions of the Cave while they remained asleep for centuries, and thus the prevention of sound from being transformed in the brain into a perception capable of causing awakening.

THE MIRACLE OF THE RELATIVITY OF TIME

Albert Einstein's Theory of Special Relativity (1905) brought about one of the greatest revolutions in human history in our understanding of the universe, space, and time. Before these discoveries, Sir Isaac Newton's classical understanding of physics was dominant. According to Newton, time was an unshakable and absolute concept that flowed at the same rate everywhere in the universe and for every observer. However, through the theories he developed, Einstein mathematically and physically demonstrated that time is not absolute; rather, it is a "relative" phenomenon that is flexible, dynamic, and changes according to the observer's state of motion.

The first step in this discovery was taken with Albert Einstein's publication of the "Theory of Special Relativity" in 1905. In this theory, Einstein started from the fact that the speed of light is constant for all observers in the universe. If the speed of light does not change, he theoretically demonstrated that time must slow down for a moving object, a phenomenon known as time dilation. In other words, as an observer in space approaches the speed of light, time passes more slowly for that observer compared with an observer who is stationary on Earth.

The second and more comprehensive step was Einstein's "Theory of General Relativity," which he completed in 1915. In this theory, Einstein explained gravity not as the mutual attraction of two bodies, as in classical physics, but as the bending of the fabric of spacetime by massive objects such as stars, planets, and

black holes. As a result of this curvature, it has been demonstrated that time passes more slowly in regions where gravity is extremely strong. For example, a few hours spent near a massive black hole or another celestial body with an extremely strong gravitational field can correspond to years or even centuries in places such as Earth, where gravity is weaker. Einstein's theories were later confirmed with extraordinary precision through atomic-clock experiments, satellite technologies such as GPS, and observations of black holes.

It was only through humanity's discoveries in 1905 and 1915 that we were able to understand that these miraculous verses, revealed 1,300 years ago and contained in the Qur'an, actually point to the relativity of time.

“And they ask you to hasten the punishment. But Allah will never fail in His promise. Indeed, a day with your Lord is like a thousand years of what you count.”

(Surah Al-Hajj, 47)

“The angels and the Spirit (Jibril) ascend to Him in a day whose measure is fifty thousand years.”

(Surah Al-Ma'arij, 4)

In fact, the temporal ratios mentioned in these verses indicate that time is not absolute; they express that the rate at which time passes can vary according to the reference system in which the observer is situated, the dimensions of the place in which one is located, or one's speed. Just as the Theory of General Relativity demonstrates that time passes differently in different gravitational fields, these verses emphasize that the perception and passage of time in different dimensions or different cosmic realms can operate

in a manner completely different from the measurements of “days” and “years” used by human beings on Earth.

When these verses were first read, they were generally interpreted as a metaphorical expression, as referring to timelessness in the presence of Allah, or as describing the length of life in the Hereafter. With Einstein’s discovery of the relativity of time in the 20th century, we were finally able to realize what these verses actually refer to. How could anyone at that time have known about General Relativity, O reader?

THE MIRACLE OF THE TRANSFORMATION OF THE FEMALE EGG

It took humanity thousands of years to understand the female reproductive system and the existence of the egg. With the Renaissance, the first findings began to be understood, thanks to the lifting of restrictions on the dissection of cadavers.

In 1561, the Italian anatomist Gabriele Falloppio described in detail the tubes connecting the uterus and the ovaries. These structures, now known in his memory as the “Fallopian Tubes,” represented the discovery of the pathway through which the egg reaches the uterus.

The next major breakthrough came in 1672 with the Dutch physician Regnier de Graaf. De Graaf noticed tiny, fluid-filled sacs within the ovarian tissue. These structures, now known as “Graafian Follicles,” were thought to be the eggs themselves. However, because microscope technology was still inadequate, the actual egg cell inside the follicle could not be distinguished on its own.

Finally, in 1827, the Estonian-born scientist Karl Ernst von Baer succeeded in isolating the actual microscopic egg cell (ovum) from the ovary of a dog under a microscope. This discovery established beyond doubt that the egg cell plays a fundamental role in the reproduction of mammals and, consequently, human beings.

In the early 20th century, with the development of tissue biology and the science of hormones (endocrinology), the

mechanism by which hundreds of eggs begin to compete each month, while only one egg is selected and the others are eliminated through cellular destruction (atresia), was fully understood.

The transformation of eggs in women and the loss of ovarian reserve constitute a highly dynamic and irreversible process that begins in the mother's womb, even before birth.

While a female fetus is in the mother's womb, her ovaries contain approximately 6 to 7 million primordial egg cells at around the fifth month of pregnancy. This is the highest number of eggs a woman will ever possess throughout her lifetime.

By the time the baby is born, this number decreases to approximately 1 to 2 million due to cellular death. By puberty, approximately 300,000 to 400,000 healthy eggs remain in the female body.

From puberty onward, hormones released by the brain (FSH and LH) stimulate the ovaries each month. At the beginning of each menstrual cycle, approximately 500 to 1,000 eggs simultaneously begin to grow in preparation for maturation.

In this competition, a single egg cell that receives hormonal signals most effectively becomes the "dominant follicle" and reaches full maturity. In the middle of the cycle, the follicle ruptures and releases the mature egg into the fallopian tubes (ovulation).

The other hundreds of eggs that began to grow lose this competition. Their growth stops, and they are absorbed by the tissue and completely eliminated (atresia).

Even if a woman ovulates only once a month, the ovarian reserve gradually declines with age because hundreds of eggs are sacrificed in the background each month. After the age of 35, the rate of loss accelerates, and when the number of remaining eggs falls below 1,000, the ovaries cease their hormonal activity and the process of menopause begins.

Yet this reality, which humanity could only discover in the 20th century, had already been indicated by the Qur'an 1,300 years ago.

“Allah knows what every female carries, and what the wombs decrease and what they increase. And with Him, everything is according to a precise measure.”
(Surah Ar-Ra'd, 13:8)

THE MIRACLE OF THE LIMITED HUMAN VISUAL SPECTRUM

The fact that the human eye is sensitive to only a “tiny window” of the enormous spectrum of light in the universe was gradually revealed between the 17th and 19th centuries.

In 1666, Sir Isaac Newton became a turning point in humanity’s understanding of the spectrum of light. By allowing a narrow beam of sunlight into a dark room and passing it through a glass prism, Newton demonstrated that white light could be separated into the colors of the rainbow, from red to violet. He named this band of colors “spectrum,” a Latin word meaning “appearance” or “image.”

Scientists in Newton’s era still believed that what could be seen constituted all of light. The experimental proof of the regions to which the human eye is blind took place at the beginning of the 19th century.

The astronomer William Herschel used mercury thermometers with blackened reservoirs to measure the temperatures of the colors emerging from the prism. He noticed that the temperature of a control thermometer placed beyond visible red, in the dark region where no light could be seen, rose even higher. Thus, infrared radiation, which cannot be seen by the human eye but can be experienced as heat, was discovered.

Inspired by Herschel’s experiment, the German physicist Johann Wilhelm Ritter placed silver-chloride paper beyond the

violet end of the spectrum. He observed that the rays in this invisible region darkened the silver chloride much more rapidly than red or violet light. This led to the discovery of ultraviolet radiation, which was initially referred to as “chemical rays.”

The English physicist Thomas Young, through the double-slit experiment demonstrating the wave nature of light, established the physical measurement of the visible spectrum. Young determined that red has the longest wavelength (~700 nanometers), while violet has the shortest (~400 nanometers). With this development, the human eye’s visual spectrum was precisely defined as being confined to approximately 380 nm to 740 nm.

After the electromagnetic spectrum had been fully mapped, biologists and optical scientists focused on the question: “Why does the human eye see only this range?”

Hermann von Helmholtz and Thomas Young developed the trichromatic theory of vision. It was understood that the cone cells on the retina, with red-, green-, and blue-sensitive opsin proteins, can convert the energy of photons primarily within approximately the ~400–700 nm range into chemical electrical signals.

The energy carried by infrared photons is too low to trigger the opsin molecules in retinal photoreceptors. The human eye can perceive these photons only at extremely high intensities, for example, with femtosecond lasers, as heat rather than by producing a normal visual chemical reaction.

The Limitation at the Filter Level (Cornea and Lens)

Studies in tissue biology during the 20th century demonstrated that the human cornea and lens naturally function as UV filters.

UVA radiation between 315–400 nm is largely absorbed by the lens, while UVB radiation below 315 nm is absorbed by the cornea.

This protects the retina from damage caused by UV radiation.

In the history of medicine, it was observed that patients who had undergone cataract surgery and had their natural lenses

removed (aphakic patients) could, if no artificial lens was implanted, perceive ultraviolet light (UVA) as a faint blue-violet color, a phenomenon known as cyanopsia. This observation confirmed that some rod cells in the retina behind the lens have a

slight sensitivity to UV, while the lens acts as a biological shield that prevents this radiation from reaching the retina.

The reality that humanity was only able to discover in the year 1800 was already pointed to 1,200 years earlier in the Qur'an, in Verse 22 of Surah Qaf:

“...Now We have removed from you your veil of heedlessness, so today your sight is sharp.”

The angels who are beside us now and record everything we do, and the jinn who surround us and try to lead us astray, are also invisible to us.

These are not stories. They are scientific realities.

You have spent your entire life calling the bird you know as a black crow “black” and moving on, without knowing that it has colors that you cannot see. You probably learned this only now.

In the same way, I say that the jinn and angels are also beside us. Perhaps you do not believe that. You will see that too once your sight is made sharp.

Unless Allah raises you blind.

“But whoever turns away from My Reminder (the Qur'an) will certainly have a miserable life, and We will raise them blind on the Day of Resurrection.”(Surah Ta-Ha, 124)

...

“And the intoxication of death will come in truth. ‘O man! This is what you have been trying to escape.’”

(Surah Qaf, 19)

“And the Trumpet will be blown. This is the Day of the promised threat.”

(Surah Qaf, 20)

“Every soul will come forth accompanied by a driver and a witness.”

(Surah Qaf, 21)

“Indeed, you were heedless of this. Now We have removed from you your veil of heedlessness, so today your sight is sharp.”

(Surah Qaf, 22)

“And his accompanying angel will say, ‘Here is what I have ready.’”

(Surah Qaf, 23)

“Allah will say: ‘Throw into Hell every stubborn disbeliever, every hinderer of good, every transgressor, every one who spreads doubt, and everyone who sets up another deity alongside Allah. Cast him into the severe punishment.’”

(Surah Qaf, 24, 25, 26)

ALLAH'S EXISTENCE CAN BE PROVEN, BUT PROVING HIS NON-EXISTENCE IS IMPOSSIBLE

If you were asked, “Is there an apple in the universe?” and you answered, “Yes, there is,” proving it would be easy. You could simply take an apple from the refrigerator and show it, and the matter would be settled. Because showing something that exists is sufficient.

If a person claims that something does not exist anywhere in the universe, proving that claim would be impossible. Looking only around his own neighborhood would not be enough. Looking throughout his country would not be enough. Even looking at every corner of the Earth would not be enough. He would have to go to every galaxy one by one and show, “Look, it is not here either,” “Look, it is not here either,” and so on, until he had examined every point in the universe individually.

For this reason, in logic, demonstrating the existence of something is generally easier than demonstrating its non-existence. If you find a single example, you have established its existence, but in order to prove its non-existence, you would have to eliminate every possibility.

Therefore, saying “It does not exist” is often a very substantial claim. Proving non-existence is impossible in every case except for situations involving material impossibilities, such as saying, “There is no square triangle.”

Therefore, no one can say, “Allah does not exist.” Even if someone were to say this, it would be impossible for them to prove it under any circumstances.

However, Allah’s existence can be proven. Its evidence can be demonstrated, and through reason, logic, and science, it can be presented, as we have done in this book, to the point of making minds ache from the sheer force of the arguments.ache with the sheer force of the evidence.

— There's no such thing as balls.

— How do you know? Did you look everywhere?

THE ARGUMENT FROM CONTINGENCY

The universe in which we live does not have to exist necessarily. In other words, when we consider the universe, the matter within it, living beings, stars, human beings, and everything else, none of their existence is of such a nature that we can logically say, “It absolutely had to be this way.” If none of these things existed, and if we did not exist, no logical contradiction would arise.

For example, if we point to a tree and say, “This tree might never have existed,” we have not said anything absurd. Because that tree could exist, but it could also have not existed at all. There is nothing that makes the existence of that tree necessary. This is what is meant by mumkin (contingent).

The word mumkin refers to something whose existence and non-existence are both possible in itself. Therefore, the fact that something exists does not mean that it exists by itself or that its existence is necessary.

Your existence, my existence, the existence of the Earth, the Sun, and, in general, the existence of beings in the universe can all be considered from this perspective. Their non-existence can be conceived. In fact, if we go a step further, they are not necessary not only in terms of whether they exist or do not exist, but also in terms of the particular form in which their existence is realized. For example, the branches of a tree may extend to the right; they could have extended to the left; they could also have not extended in that

particular way at all. There is no necessity that the branches of every tree must extend to the right.

For example, it is possible for a human being to exist. But the fact that a particular human being is exactly you, that you have these particular characteristics, that you were born at this particular time, from these particular parents, that you have this particular height, these particular fingerprints, and that you have lived this particular life are all specifically determined circumstances. Each of these could have been otherwise.

Likewise, apart from the existence of the Earth itself, it was also possible for the Earth's size, its distance from the Sun, its atmosphere, its diversity of life, and countless other characteristics to have been different.

“If something has come to exist in only one way among many different possibilities, why did it come to exist specifically in this way?”

Let us imagine something. Suppose there is a field of possibilities before us containing numerous possibilities labeled “A, B, C, D...” Any one of them is possible. But suppose that, in the end, A has occurred. Then the following question arises:

“What distinguishes A from the other possibilities and causes A to occur?”

Every mumkin is dependent upon a cause outside itself.

The fact that something possible exists is not, by itself, a sufficient explanation for its existence. Because within itself, it

contains the possibility both of existing and of not existing. Therefore, the answer to the question “Why does it exist?” cannot be found within the thing itself.

There is a very important distinction here: a cause is not merely that which brings something into existence; it is also that which determines one possibility among the possible alternatives.

Imagine, for example, an empty glass on a table. It is possible for the glass to remain empty, possible for it to be filled with water, and possible for it to be filled with milk.

When we ask,

“Why is the glass filled with water?”

the answer,

“Because the glass is filled with water,”

is not an explanation.

It merely repeats the outcome. The fact that something has occurred does not explain why it occurred in that particular way.

In the same way, when we consider the existence of the universe, there are two possibilities: it could have existed, or it could have not existed. Yet it exists now. Therefore, the question “Why does it exist?” arises. But this is not the end of the matter.

Because the universe does not merely exist; it exists in a particular way. It possesses particular laws, particular physical

constants, particular initial conditions, particular arrangements of matter, and countless other characteristics.

Therefore, the question becomes twofold:

“Why is there something rather than nothing?”

“And since something exists, why does it exist specifically in this way?”

For example, imagine a painter standing before a blank white canvas. It is possible to draw nothing on the canvas, possible to draw a red circle, and possible to draw a blue triangle. If the painter ultimately draws a red circle, then the question “Why a red circle?” cannot be answered from the canvas itself. There is no necessity within the canvas that requires a red circle to be drawn.

A determiner, a preferer, is required.

In the same way, considered in itself, the universe does not necessitate one particular mode of existence. Therefore, in order to explain the existence of the universe and its particular characteristics, there must necessarily be an explanatory cause outside the universe itself.

This determining and explanatory cause can only be Allah.

Pay attention! We are not merely saying here, “The universe has a beginning; therefore, Allah exists.”

First, we are asking:

“Why does the universe exist, and why does it possess all of these particular characteristics?”

“Because the universe is mumkin. That which is mumkin cannot explain its own existence through itself. Therefore, it needs a cause that explains its existence. But if that cause is another mumkin being, then the problem has merely been moved one step backward:

‘Then who brought that into existence?’

This way of thinking, which traps us in a vicious circle, does not provide an explanation.

Therefore, it is necessary to affirm the existence of a Necessary Being, one whose existence is not dependent upon anything else, who does not require an external cause in order to exist, and who is not mumkin. In Islamic terminology, this is Wājib al-Wujūd, the One whose existence is necessary and whose non-existence is inconceivable.

Let us illustrate this once again so that it can be understood clearly.

Suppose we look at the oval wooden table in the living room and ask, “Why does this table exist, and why is it oval, and why is it made of wood?”

The answer,

“Because it is that table,”

cannot be accepted as an explanation.

Likewise, when we ask, “Why does the universe exist, and why are gravity, planets, animals, human beings, organs, cells, and all these things the way they are?”

the answer,

“Because the universe is like this. Because that is simply how it is,”

cannot be an explanation.

A universe based on carbon and hydrogen, with every living being possessing its own distinct purpose and exhibiting different forms of design, has come into existence from among countless, even infinitely many, possible configurations.

These particular configurations did not have to exist. A universe made entirely of fire or entirely of crystal could have existed instead.

Therefore, when we ask, “Why does the universe exist, and why does it exist in this particular way?” we cannot simply say, “Because it is the universe; that is just how it is.”

There must necessarily be a Being who has existed from eternity, who will exist forever, who is unchanging and absolute, who has power over all things, and whose choices, unaffected by anything, have determined the universe to exist in this particular way.

The conclusion we have reached here is not one arrived at emotionally!

It is the conclusion that is necessary according to reason and logic!
